Windows 10 App Controls

Windows 10 App Controls

Windows 10 App Controls is a package of DevExpress technologies that help you to quickly begin developing Universal Apps for Windows 10. These controls provide functionality that is specific to the Windows UI and is common to writing business applications.

The main benefits of using DevExpress Win10 App Controls:

- you can write your application with these controls using XAML/C# or XAML/VB, and deploy the application to various devices: PCs, notebooks, slates, phones, transformers, etc.;
- you can easily implement an application layout and all interface elements that are specific to Windows 10 because we already have these controls for you;
- with our controls, you will easily deliver the Windows UI style (former METRO style) to your applications because all our controls have a set of predefined Windows UI themes.

Note	
The minimum platform version for UWP applications that use DevExpress Win10 App Controls is **Windows 10 Fall Creators Update (10.0; Build 16299)**.	

This documentation contains the following sections.

- Prerequisites

Describes system requirements before you install this product on a development machine.

- Getting Started

© 2018 Developer Express Inc.

Introduces common information on using DevExpress Win10 App Controls.

- Controls

Contains documentation for each product included in this suite.

- Localization

Provides information on how to localize Win10 App Controls into various languages.

- Get More Help

Describes alternative information sources on using DevExpress products and services.

- Themes and Color Schemes

Provides information on how to customize the color scheme of your application.

- **API Reference**

Contains a description of the product's public API.

© 2018 Developer Express Inc.

Prerequisites

This document describes system requirements needed to install DevExpress Win10 App Controls on a development machine.

System Requirements

- **Windows 10** 1709 (OS Build 16299) or higher
- Windows 10 SDK 16299 or higher
- **Visual Studio 2017** version 15.4.0 or higher
- **Microsoft.NETCore.UniversalWindowsPlatform** version 6.0.1 or higher

Note
The minimum platform version for UWP applications that use DevExpress Win10 App Controls is **Windows 10 Fall Creators Update (10.0; Build 16299)**.

© 2018 Developer Express Inc.

Getting Started

Windows 10 App Controls > Getting Started

Universal Windows Platform is a development technology introduced by Microsoft in Windows 10. Before starting to develop applications for Windows 10, we recommend you get acquainted with this technology.

The following is the list of basic resources provided by Microsoft for Windows 10 app developers.

- Windows Dev Center
https://dev.windows.com/en-us/

- Get Started with UWP
https://docs.microsoft.com/en-us/appcenter/sdk/getting-started/uwp

- Desktop App Development Documentation
https://msdn.microsoft.com/en-us/library/windows/desktop/hh447209(v=vs.85).aspx

- Design applications for the Windows desktop
https://developer.microsoft.com/en-us/windows/desktop/design

- Windows Store app samples
https://code.msdn.microsoft.com/windowsapps/

Referencing DevExpress UWP Assemblies To Build Applications Using Cloud Services

Adding DevExpress UWP controls from the toolbox automatically references the corresponding DevExpress Software Development Kit (SDK).

To build an application that uses DevExpress UWP controls on a build server that doesn't have the required SDK installed, you need to manually reference the required assemblies instead. To do this, open the **Reference Manager** dialog (for instance, using the **PROJECT | Add Reference** menu item), click the **Browse** button, navigate to the "*Components\Bin\UWP*" folder within the installation folder ("*C:\Program Files (x86)\DevExpress 17.2*", by default) and select the assemblies.

Below is a list of redistributable DevExpress UWP assemblies.

Cross-Platform Assemblies	Description
DevExpress.Core.v18.1.dll	Contains basic and utility classes.
DevExpress.UI.Xaml.v18.1.dll	Contains basic and utility classes used by UWP controls.
DevExpress.Mvvm.v18.1.dll	Contains classes that support the MVVM design pattern.
DevExpress.Drawing.v18.1.dll	Contains utility classes that support rendering functionality
DevExpress.Pdf.v18.1.Core.dll	Contains internal classes that provide the basic functionality to parse and render PDF files.
DevExpress.Themes.v18.1.dll	Contains resources for the visual themes.
DevExpress.UI.Xaml.Charts.v18.1.dll	Contains the components that are included in the UWP Charts suite.
DevExpress.UI.Xaml.Controls.v18.1.dll	Contains controls such as the Range Control, PDF Viewer and RadialContextMenuControl.
DevExpress.UI.Xaml.Editors.v18.1.dll	Contains the basic editors and controls.
DevExpress.UI.Xaml.Gauges.v18.1.dll	Contains the components that are included in the UWP Gauges suite.
DevExpress.UI.Xaml.Grid.v18.1.dll	Contains the components that are included in the UWP Data Grid suite.
DevExpress.UI.Xaml.Layout.v18.1.dll	Contains the components and controls that provide the Navigation and Layout functionality.
DevExpress.UI.Xaml.Map.v18.1.dll	Contains the components that are included in the UWP Map Control suite.
DevExpress.UI.Xaml.Ribbon.v18.1.dll	Contains the components that are included in the UWP Ribbon Control suite.

Controls

Windows 10 App Controls > Controls

The following products are included in the DevExpress Windows 10 Apps Subscription.

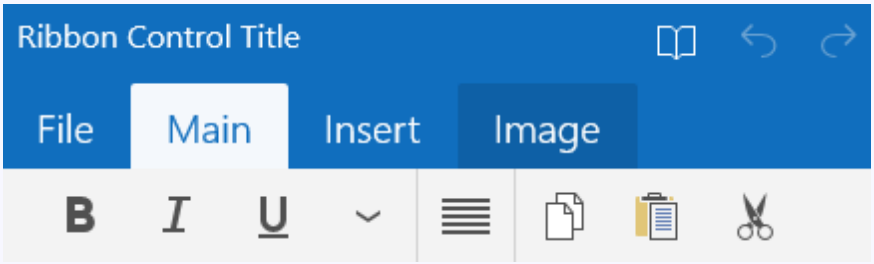
- Navigation and Layout
- Data Editors
- Data Grid
- Charts
- Map Control
- Gauges
- PDF Viewer
- SVG Icon
- Context Menu

© 2018 Developer Express Inc.

Navigation and Layout

Windows 10 App Controls > Controls > Navigation and Layout

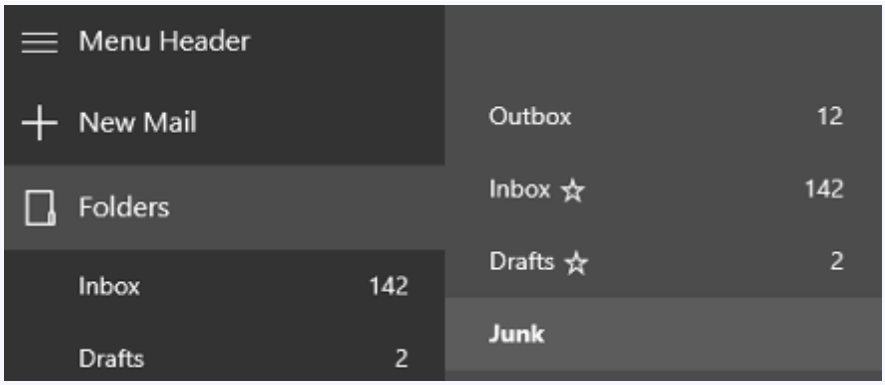
The following DevExpress Win10 App controls enable you to build a simple or compound layout of controls within a form with intrinsic support for consistent control arrangement.



Ribbon Control

The Ribbon Control provides a light, modern and sharper looking way to organize your application menus by grouping your commands into separate tabs and groups. The control ships with the following features.

- Two different displaying modes (Normal, and AutoHide).
- Support for auto-hiding less important items when the control's size is reduced and a flexible way to design the corresponding auto-hide rules.
- A root application menu represented by Backstage View.
- The embedded Help Pane element that contains the most commonly used items.



Hamburger Menu

The Hamburger Menu is a powerful control that unites capabilities of menu and navigation systems. While the navigation items and sub-items provides a flexible way to implement the navigation functionality of the desired complexity, radio groups, checkboxes, hyperlinks, etc. allows you to provide an end-user with an easy way to change settings of your application and execute various commands. In addition to the mentioned capabilities, the Hamburger Menu also provides the following features:

- Three different View States with the support for the adaptive layout.

© 2018 Developer Express Inc.

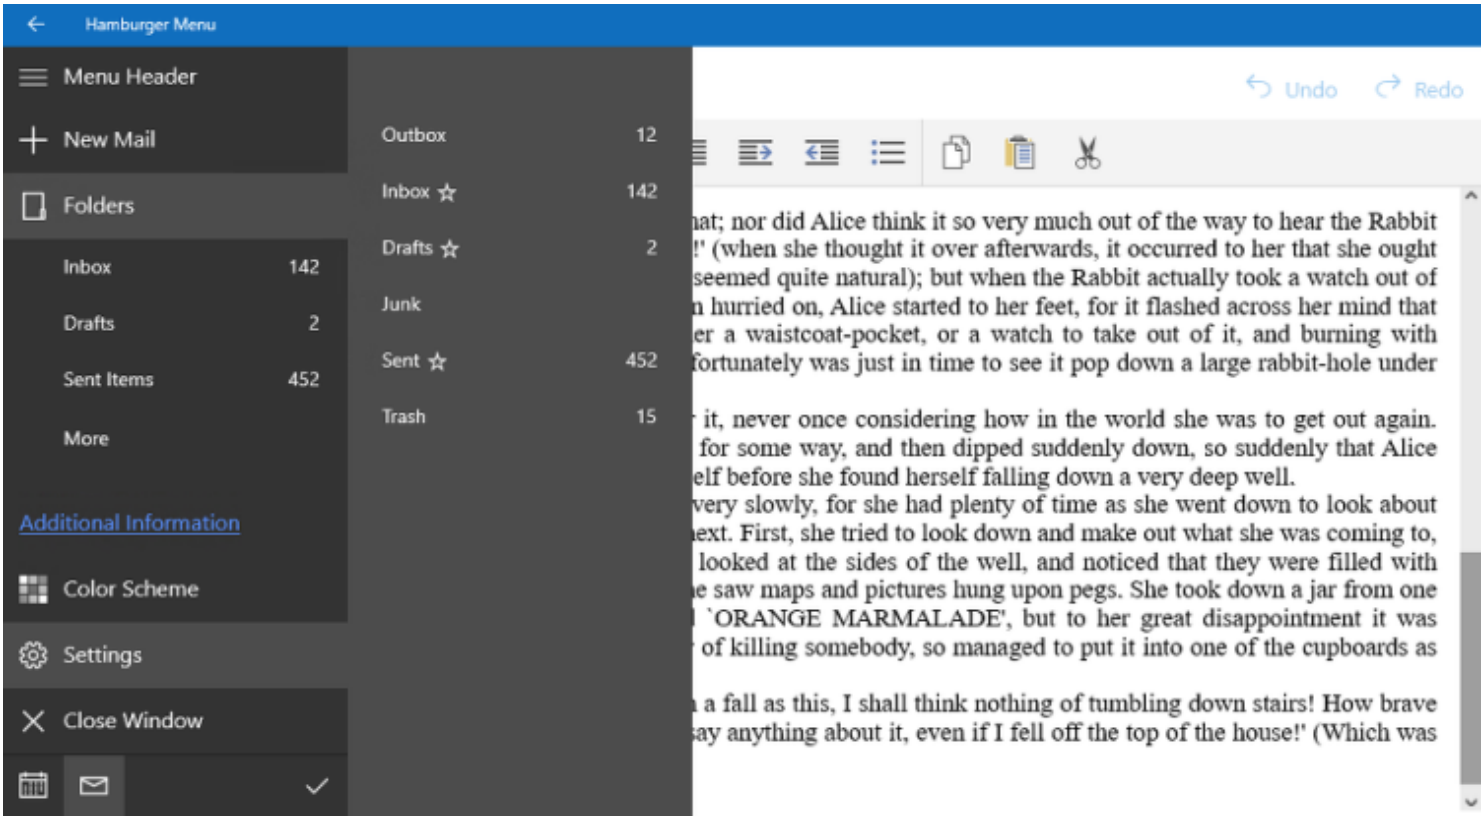
	• The embedded interaction with the application frame and the capabiltiy to customize the title. • Automatic synchronization with the currently selected page. • A special BottomBar section that may contain the most popular application commands.
	**Layout Control** The Layout Control enables you to build a simple or compound layout of controls within a form with the intrinsic support for consistent control arrangement. It's features include: • Ability to use controls as group items. • Expandable and borderless groups. • Ability to specify different layout directions of items in the Landscape and Portrait modes. • Automatic control rearrangement when the application's snapped state is enabled. • MVVM design pattern support enabling you to populate groups with items from underlying data collections.
	**Master-Detail Pattern** The Master-Detail Pattern is used to build a list-details layout. It's features include: • Stacked and side-by-side display modes. • Adaptive layout. • MVVM support.

© 2018 Developer Express Inc.

Hamburger Menu

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu

The DevExpress **Hamburger Menu** allows you to implement the navigation UI in your Universal Windows applications.



These are the main **Hamburger Menu** features:

- Adaptive Layout;
- The main menu supporting top and bottom alignment for items;
- Different types of navigation items: regular, check and radio buttons, and hyperlinks;
- Sub menus displaying items in side panels and "favorite" items directly in the main menu;
- A compact bottom bar;
- Context Menus;
- MVVM Support.

The Getting Started tutorial describes basics of creating applications that use the **Hamburger Menu** for navigation.

© 2018 Developer Express Inc.

Visual Elements

Topics in this section:

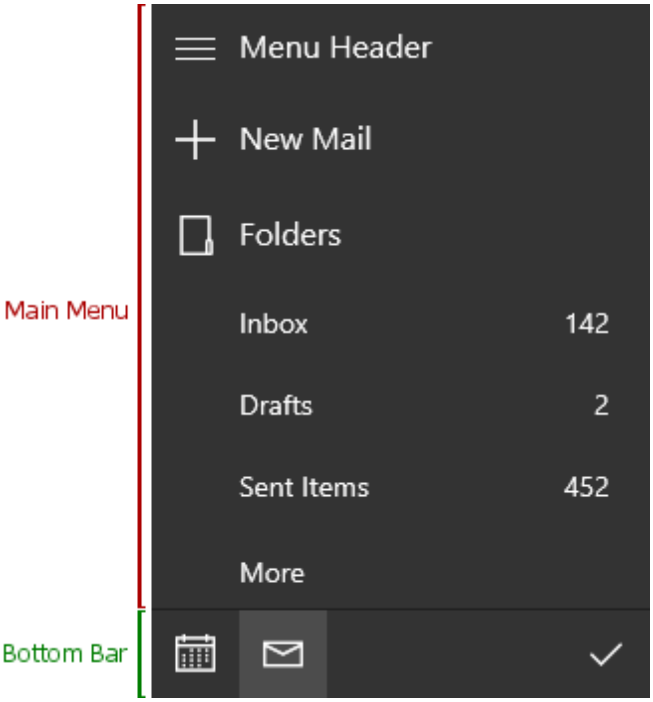
- Main Menu
- Sub Menu
- Bottom Bar
- Context Menus

© 2018 Developer Express Inc.

Main Menu

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Visual Elements > Main Menu

The main section of the **Hamburger Menu** contains navigation commands that are represented by buttons with icons and captions.



To specify the collection of the main menu, use the HamburgerMenu.Items property or declare buttons between the **Hamburger Menu**'s opening and closing tags in XAML. You can add the following buttons to the collection.

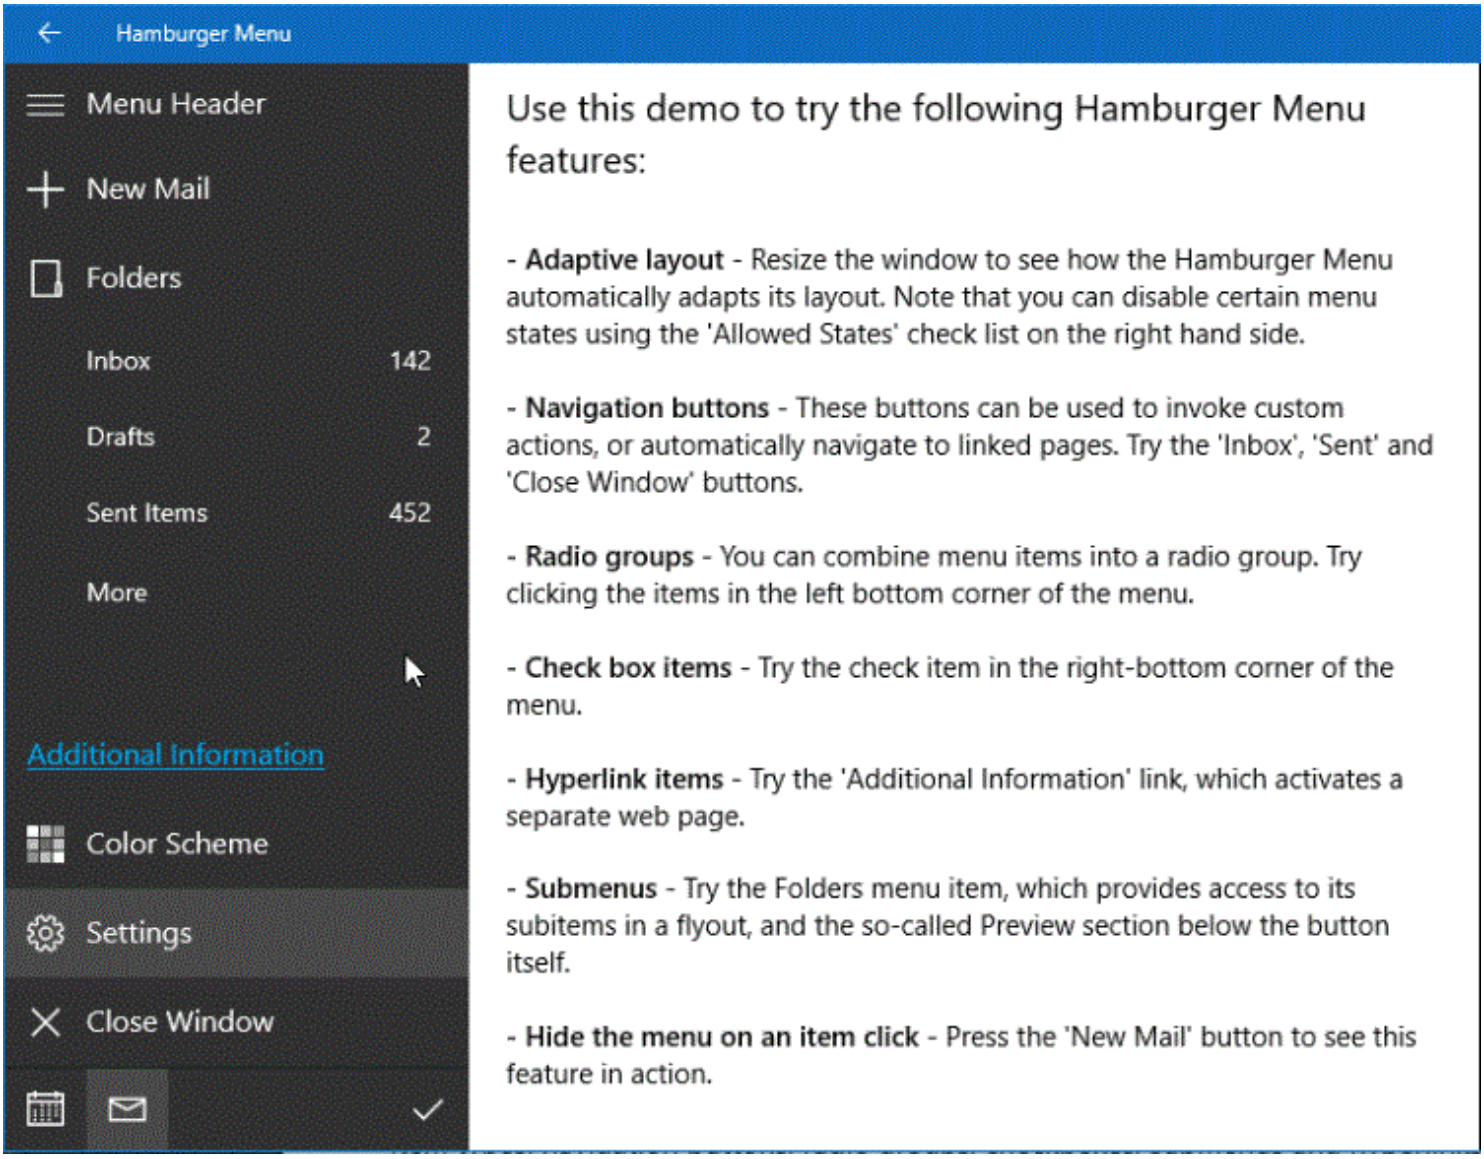
- HamburgerMenuNavigationButton - a regular button with a glyph and caption that navigates an end-user to the page specified with the button's HamburgerMenuNavigationIconButton.NavigationTargetType or HamburgerMenuNavigationIconButton.NavigationTargetTypeName property;
- HamburgerSubMenu - a Sub Menu that is a flyout panel containing additional navigation items;
- HamburgerMenuHyperlinkButton - a hyperlink that invokes the default browser and navigates to the URI specified with the button's **NavigateUri** property.

© 2018 Developer Express Inc.

Sub Menu

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Visual Elements > Sub Menu

The **Sub Menu** is a flyout panel that allows you to extend the Main Menu.



To create a sub menu, place the HamburgerSubMenu control into the HamburgerMenu.Items collection. To specify the collection of sub menu items, use the HamburgerSubMenu.Items property. This collection accepts the HamburgerSubMenuNavigationButton objects.

You can display sub menu items directly in the main menu below the sub menu button in preview. To add a sub menu item to the preview, set its HamburgerSubMenuNavigationButton.ShowInPreview property to **true**.

You can also specify the flyout panel's caption and its attributes using the HamburgerSubMenu.FlyoutHeader, HamburgerSubMenu.FlyoutHeaderHeight and HamburgerSubMenu.FlyoutHeaderPadding properties.

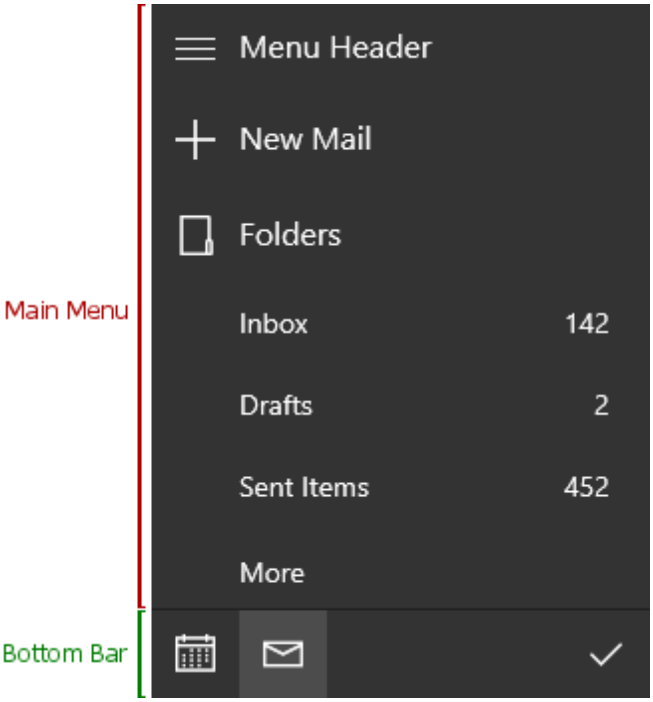
By default, when a sub menu item is selected, the item previously selected in the main menu is automatically deselected. Set the HamburgerSubMenu.IsStandaloneSelectionItemMode property to **true** to enable independent selection for the main menu and current sub-menu. If this option is enabled, selecting an item in the current sub-menu does not discard the selection in the main menu.

© 2018 Developer Express Inc.

Bottom Bar

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Visual Elements > Bottom Bar

The **Hamburger Menu** displays the bottom bar in addition to the main menu. This bar is placed at the bottom of the **Hamburger Menu** and displays buttons that support icons as content.



To specify the collection of bottom bar items, use the HamburgerMenu.BottomBarItems property. This collection accepts the following buttons:

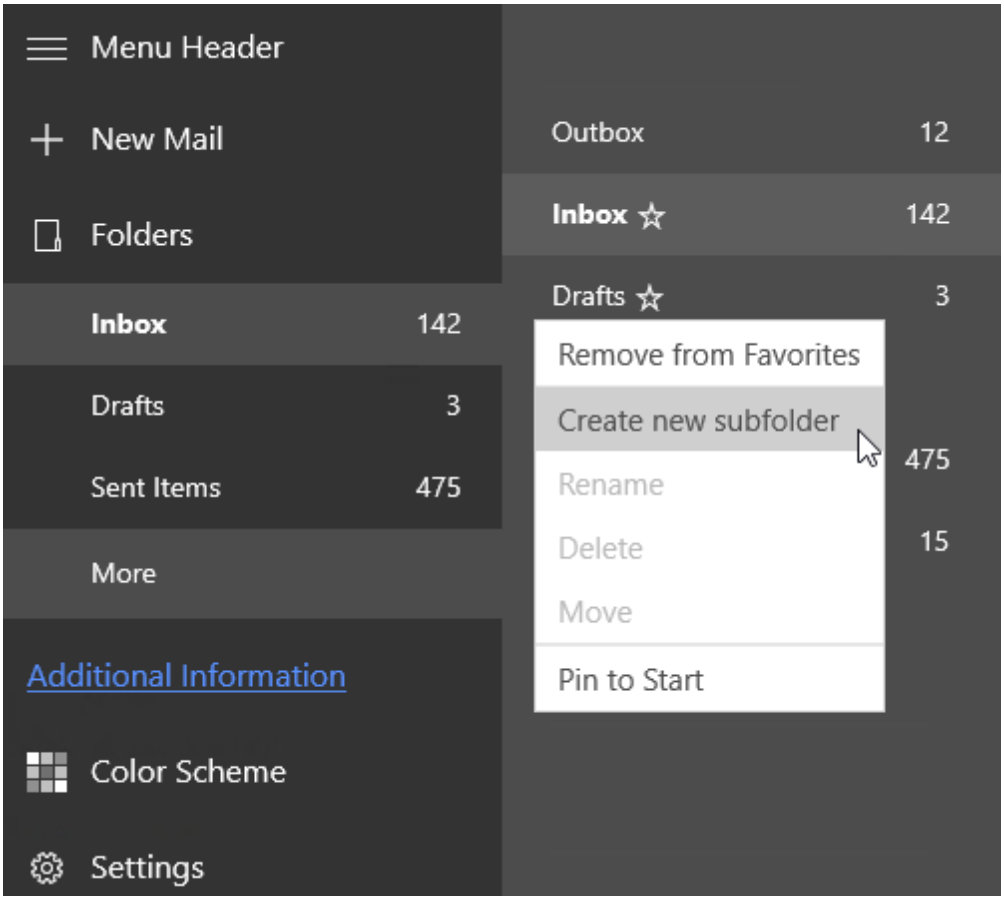
- HamburgerMenuBottomBarNavigationButton - a regular button with glyph that navigates an end-user to the page specified with the button's HamburgerMenuNavigationIconButton.NavigationTargetType or HamburgerMenuNavigationIconButton.NavigationTargetTypeName property;
- HamburgerMenuBottomBarRadioButton - a button that allows an end-user to select an option from a group of options;
- HamburgerMenuBottomBarCheckBox - a button that an end-user can select (check) or clear (uncheck).

© 2018 Developer Express Inc.

Context Menus

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Visual Elements > Context Menus

The Hamburger Menu provides context menus that can be invoked by right-clicking Main Menu or Sub Menu items and provide the ability to perform actions linked to these items.



To add a context menu to a Main Menu item, assign it to the item's HamburgerMenuNavigationButton.ContextMenu property.

For a regular Sub Menu item, use the HamburgerSubMenuNavigationButton.ContextMenu property. The HamburgerSubMenuNavigationButton.PreviewContextMenu property specifies the context menu that is used when the item is shown in the preview. To use the context menu assigned to the HamburgerMenuNavigationButton.ContextMenu property for both regular sub menu and preview, set the HamburgerSubMenuNavigationButton.UseContextMenuAsPreview property to **true**.

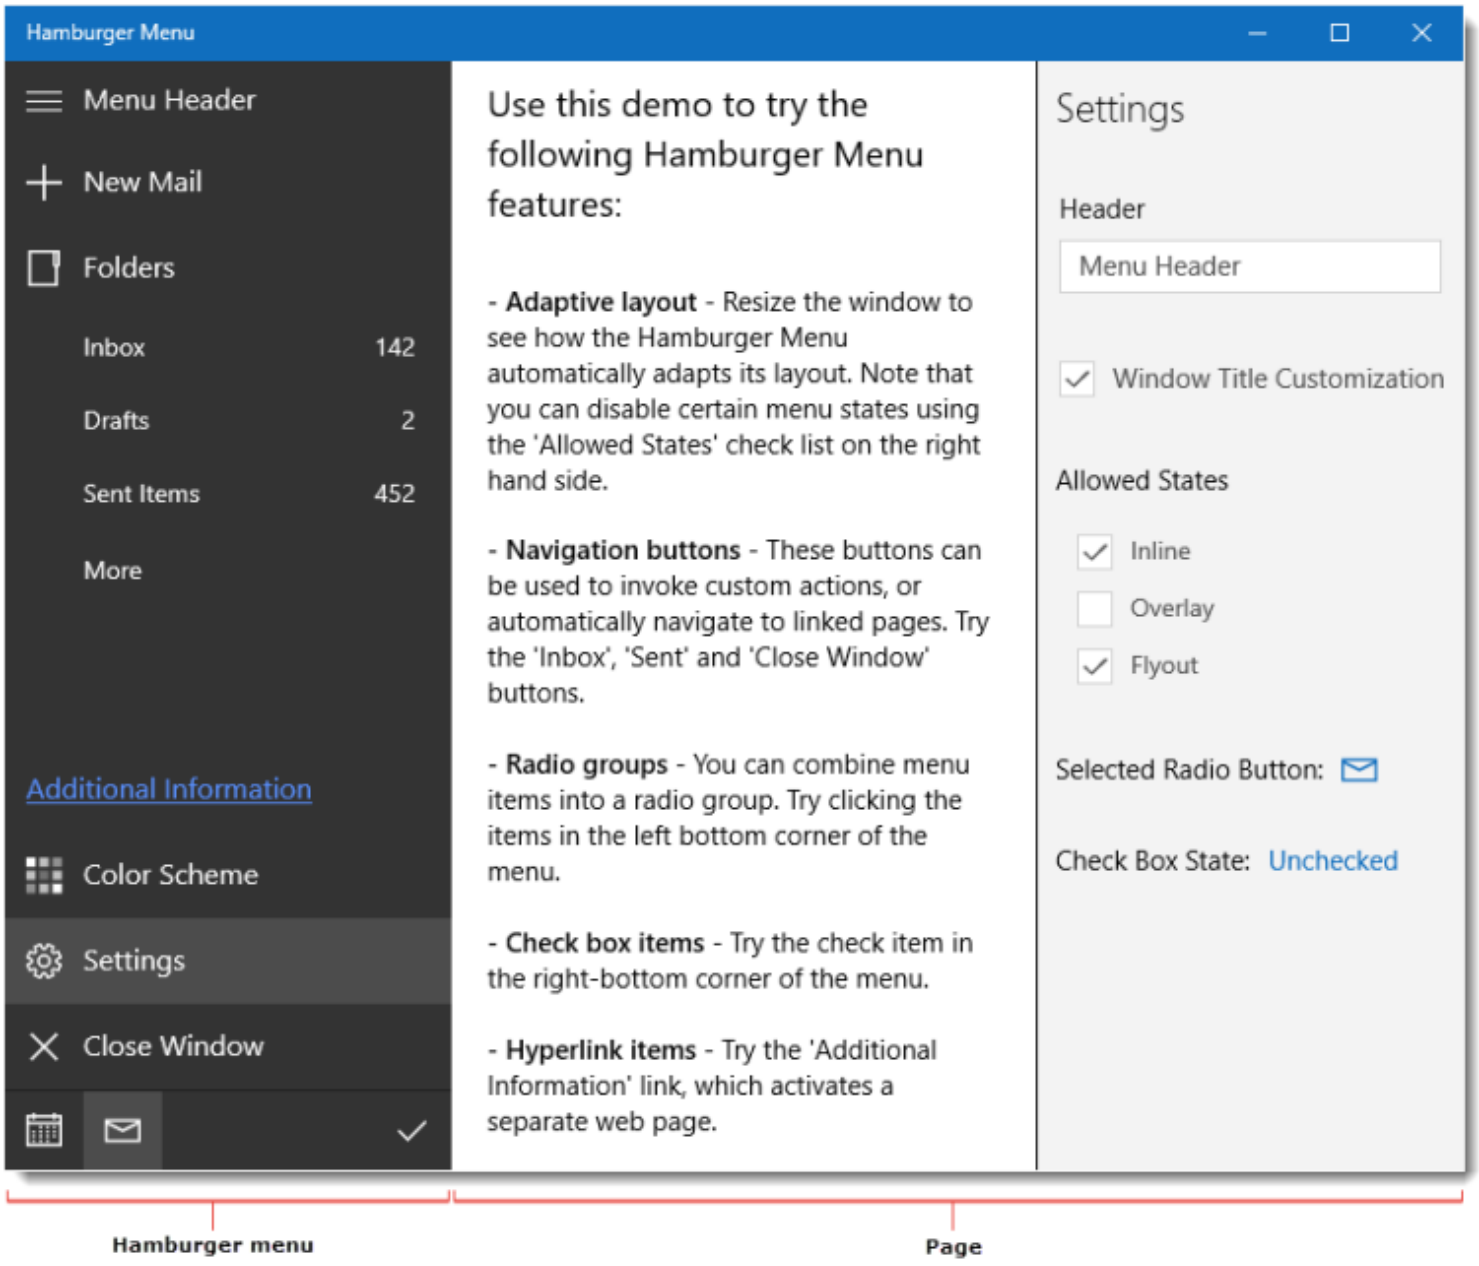
To customize a context menu's content and behavior, handle the following events: HamburgerMenu.ContextMenuOpening, HamburgerMenu.ContextMenuOpened, HamburgerMenu.ContextMenuClosed.

© 2018 Developer Express Inc.

Getting Started

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Getting Started

The main component of the **Hamburger Menu** is the HamburgerMenuFrame that represents a frame with two views. One view displays the HamburgerMenu, which is used to display navigation commands to end-users. The other view displays pages to which an end-user navigates using these commands. In the image below, you can see an application that uses the **Hamburger Menu Frame** as a root application frame. When an end-user clicks/taps a navigation button in the left-side menu, the navigation target page is displayed on the right-side area.



To use the HamburgerMenu navigation in your application, drop the HamburgerMenuFrame from the Toolbox to the application's main page in Visual Studio.

The HamburgerMenuFrame contains the HamburgerMenu as its content. You can populate the menu with navigation buttons and specify navigation target pages for the buttons. For this, use the button's **NavigationTargetTypeName** or **NavigationTargetType** property. For more details and examples, see the HamburgerMenu class.

You can also use the HamburgerMenuFrame as a root frame of your application. Create a HamburgerMenuFrame instance and set it as a visual root element in the application's **OnLaunched** method, as shown below.

© 2018 Developer Express Inc.

C#

```
sealed partial class App : Application {
    // ...
    protected override void OnLaunched(LaunchActivatedEventArgs e) {
        // ...
        Frame rootFrame = Window.Current.Content as Frame;
        // Do not repeat app initialization when the Window already has content,
        // just ensure that the window is active
        if (rootFrame == null)
        {
            // Create a Frame to act as the navigation context and navigate to the first page.
            // The constructor's parameter specifies the page used to render the menu.
            rootFrame = new DevExpress.UI.Xaml.Layout.HamburgerMenuFrame(typeof(HamburgerMenuPage));
            // Place the frame in the current Window
            Window.Current.Content = rootFrame;
        }
    }
}
```

Visual Basic

```
NotInheritable Partial Class App
    Inherits Application
    ' ...
    Protected Overrides Sub OnLaunched(e As LaunchActivatedEventArgs)
        ' ...
        Dim rootFrame As Frame = TryCast(Window.Current.Content, Frame)
        ' Do not repeat app initialization when the Window already has content,
        ' just ensure that the window is active
        If rootFrame Is Nothing Then
            ' Create a Frame to act as the navigation context and navigate to the first page.
            ' The constructor's parameter specifies the page used to render the menu.
            rootFrame = New DevExpress.UI.Xaml.Layout.HamburgerMenuFrame(GetType(HamburgerMenuPage))
            ' Place the frame in the current Window
            Window.Current.Content = rootFrame
        End If
    End Sub
End Class
```

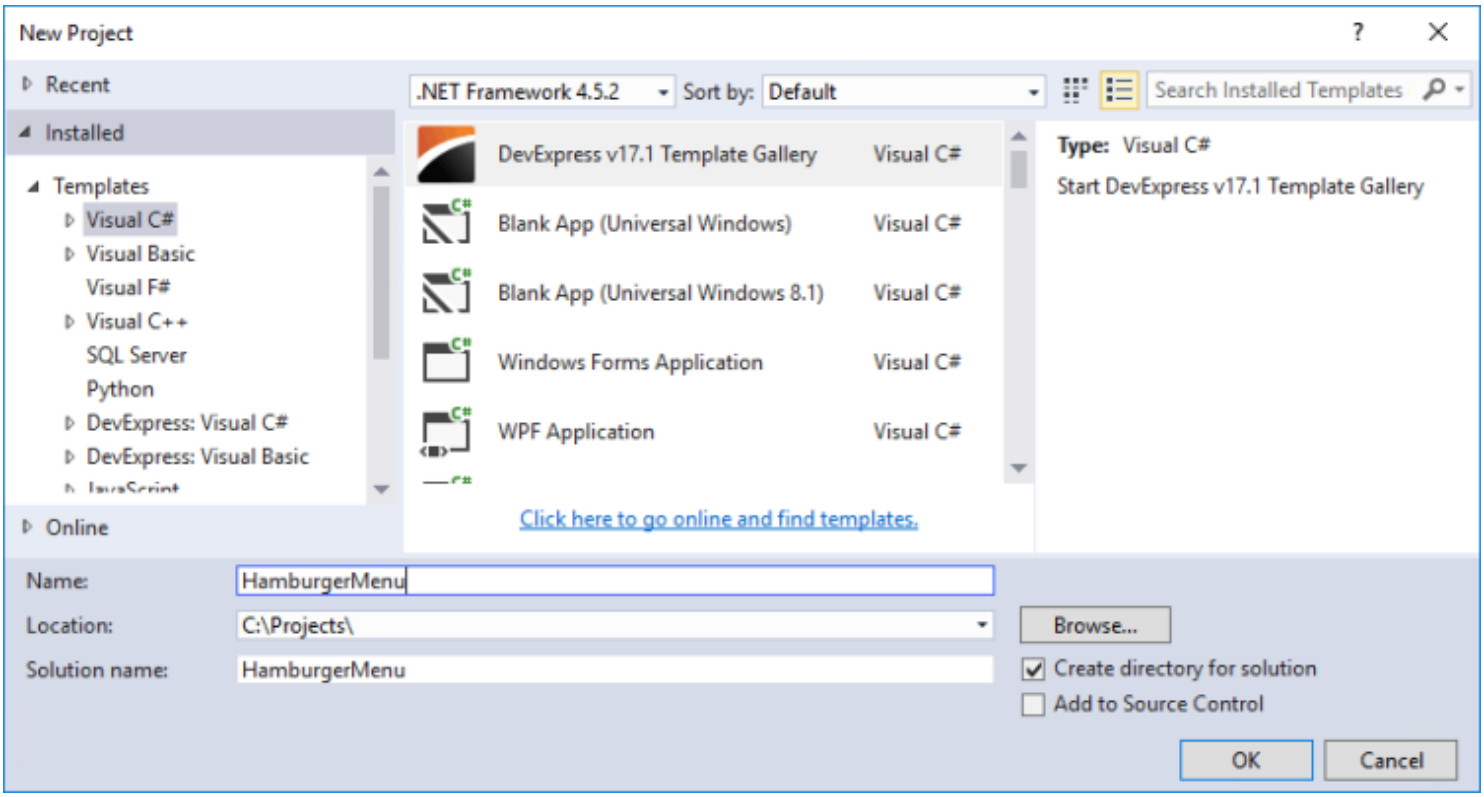
In this case, you are using the HamburgerMenuFrame constructor with the *hamburgerMenuPageType* parameter that specifies the page used to render the menu. The specified page should contain the HamburgerMenu as a child. See the example below.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:App13"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Layout="using:DevExpress.UI.Xaml.Layout"
    x:Class="MyApp.HamburgerMenuPage"
    mc:Ignorable="d">
    <Layout:HamburgerMenu>
        <Layout:HamburgerMenu.BottomBarItems>
            <Layout:HamburgerMenuBottomBarNavigationButton NavigationTargetTypeName="SettingsPage">
                <SymbolIcon Symbol="Setting"/>
            </Layout:HamburgerMenuBottomBarNavigationButton>
            <Layout:HamburgerMenuBottomBarNavigationButton NavigationTargetTypeName="FeedbackPage">
                <SymbolIcon Symbol="Emoji2"/>
            </Layout:HamburgerMenuBottomBarNavigationButton>
        </Layout:HamburgerMenu.BottomBarItems>
        <Layout:HamburgerMenuNavigationButton Content="Home" IsSelected="True" NavigationTargetTypeName="
            <Layout:HamburgerMenuNavigationButton.Icon>
                <SymbolIcon Symbol="Home"/>
            </Layout:HamburgerMenuNavigationButton.Icon>
        </Layout:HamburgerMenuNavigationButton>
        <Layout:HamburgerMenuNavigationButton Content="My Page" NavigationTargetTypeName="MyPage" Placemer
            <Layout:HamburgerMenuNavigationButton.Icon>
                <SymbolIcon Symbol="Page"/>
            </Layout:HamburgerMenuNavigationButton.Icon>
        </Layout:HamburgerMenuNavigationButton>
        <Layout:HamburgerMenuHyperlinkButton Content="Support" HorizontalContentAlignment="Center" Navigat
    </Layout:HamburgerMenu>
</Page>
```

Alternatively, you can use our Template Gallery to create an application with a predefined Hamburger Menu and page templates.

- Click **FILE | New | Project...** to invoke the **New Project** dialog. In the invoked **New Project** dialog, select the Visual C# group, select the **DevExpress v18.1 Template Gallery** pattern, and click **OK**.



- Select the **Windows 10 Apps** platform and choose a language. Then, select the **Hamburger Menu** item (or the **Hamburger Menu (MVVM)** item if you also need the ViewModel template) and click the **Create Project** button.

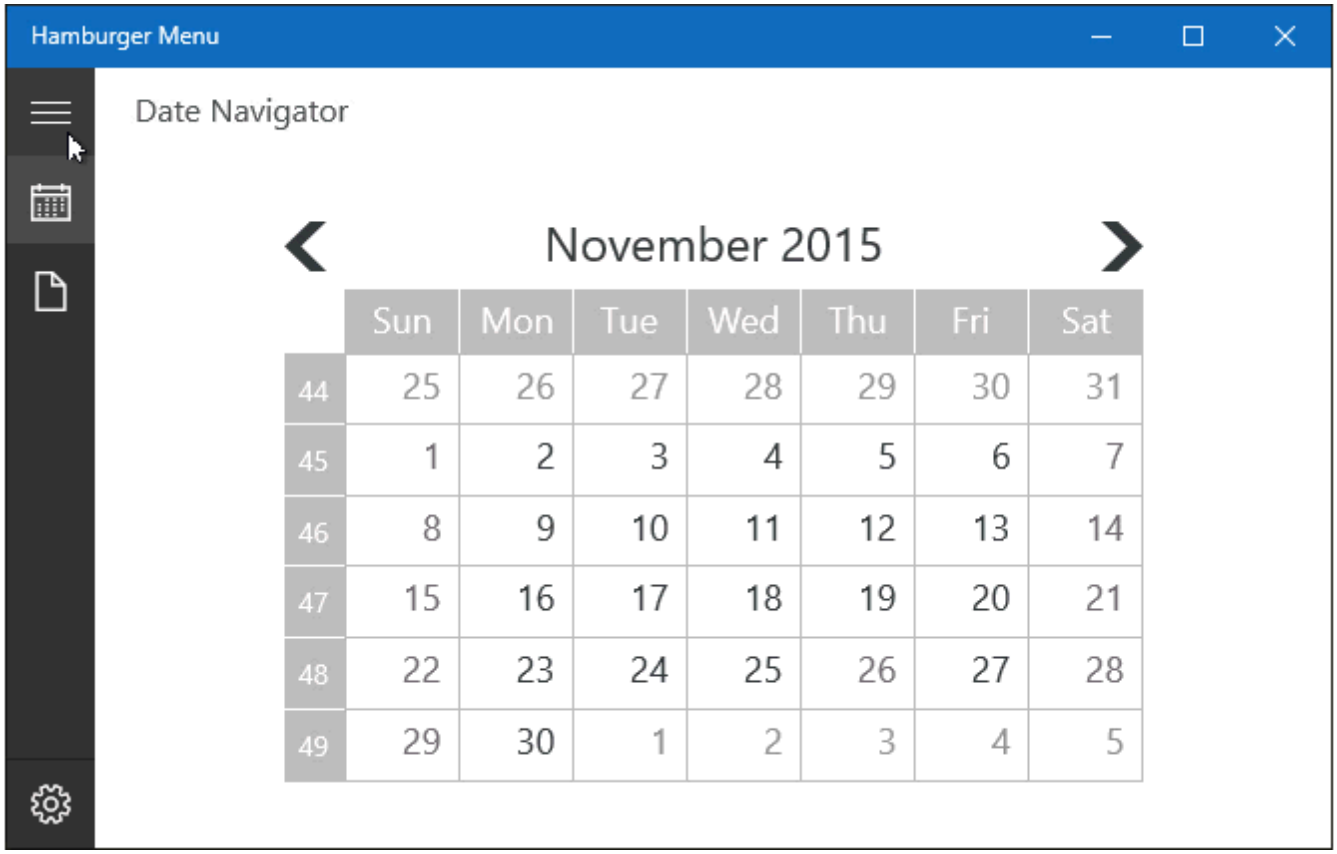
Adaptive Layout

Windows 10 App Controls > Controls > Navigation and Layout > Hamburger Menu > Adaptive Layout

The **Hamburger Menu** automatically changes its view according to the application window width. The menu provides three states that you can set by specifying the HamburgerMenu.AvailableViewStates property:

- **Inline** - for wider UI layouts. The menu is displayed expanded inline with the main content.
- **Overlay** - a menu is collapsed and can be expanded overlaying the content. To specify the window width after which this state is enabled, use the HamburgerMenu.CompactOverlayStateFrameThreshold property;
- **Flyout** - for narrower UI layouts. The menu is minimized up to the hamburger button, which invokes the menu fly-out. To specify the window width after which this state is enabled, use the HamburgerMenu.MinimizedFlyoutStateFrameThreshold property.



© 2018 Developer Express Inc.

MVVM Support

The **Hamburger Menu** allows you to implement the MVVM design pattern.

Use the HamburgerMenuNavigationIconButton.NavigationTargetTypeName or HamburgerMenuNavigationIconButton.NavigationTargetType property to specify the navigation target page for a button. See the example below.

Xaml

```
<Layout:HamburgerMenu>
    <Layout:HamburgerMenuNavigationButton Content="My Page" NavigationTargetTypeName="MyPage"/>
</Layout:HamburgerMenu>
```

Xaml

```
<Page x:Class="DXSample.MyPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:DXSample"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    mc:Ignorable="d">
    <Grid Background="LightGreen">
        <TextBlock Text="My Page" VerticalAlignment="Center" HorizontalAlignment="Center" FontSize="32" Fo
    </Grid>
</Page>
```

Another approach is to generate menu items based on a data source collection. Use the HamburgerMenu.ItemsSource property to bind the menu to data. The HamburgerMenu.ItemTemplate property allows you to specify the template used to render items from the data source. Use the HamburgerMenu.ItemTemplateSelector property to implement custom template selection logic.

For sub menus, use the HamburgerSubMenu.ItemsSource, HamburgerSubMenu.ItemTemplate and HamburgerSubMenu.ItemTemplateSelector properties.

For the bottom bar, use the HamburgerMenu.BottomBarItemsSource, HamburgerMenu.BottomBarItemTemplate, HamburgerMenu.BottomBarItemTemplateSelector properties.

See the example below.

Xaml

```
<Page x:Class="DXSample.HamburgerMenuPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:DXSample"
    xmlns:ViewModel="using:DXSample.ViewModel"
    xmlns:Layout="using:DevExpress.UI.Xaml.Layout"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    mc:Ignorable="d">
    <Page.Resources>
        <DataTemplate x:Key="HamburgerMenuItemTemplate" x:DataType="ViewModel:HamburgerMenuItemViewModel">
            <Layout:HamburgerMenuNavigationButton Content="{x:Bind Caption}" IconSource="{x:Bind Icon}" Na
        </DataTemplate>
    </Page.Resources>
    <Layout:HamburgerMenu WindowTitle="Hamburger Menu Demo" IsMenuVisible="{Binding IsMenuVisible}" Items
</Page>
```

Layout Control

Windows 10 App Controls > Controls > Navigation and Layout > Layout Control

The LayoutControl enables you to build a simple or compound layout of controls within a form with the intrinsic support for consistent control arrangement.

The LayoutControl consists of items that can be combined into titled, expandable or borderless groups. A typical layout item is encapsulated by the LayoutItem class. It represents a header and content pair, where any control can be used as the item's content. However, you are not limited to using only LayoutItems as group content. You can use any control you wish.

The following is a list of major LayoutControl features.

- Consistent control lay-outing without overlapping (ensured by combining items into groups).
- Expandable and borderless groups.
- Items in groups can be arranged in a horizontal or vertical direction.
- Automatic alignment of item headers within groups.
- Ability to specify different layout directions of items in the Landscape and Portrait modes.
- Automatic control rearrangement when the application's snapped state is enabled. Item headers are automatically moved to the top of controls and items within groups are vertically oriented (provided that the group's orientation was not forcibly set).
- Layout items are highlighted when focused.
- Ability to control a layout item's size (item stretching, auto-size and proportional size) and spacing.
- Multiple items can be combined into a single cell and as such overlap each other. This allows you to display text over an image, for instance.
- Ability to use controls as group items.
- MVVM design pattern support enabling you to populate groups with items from underlying data collections.

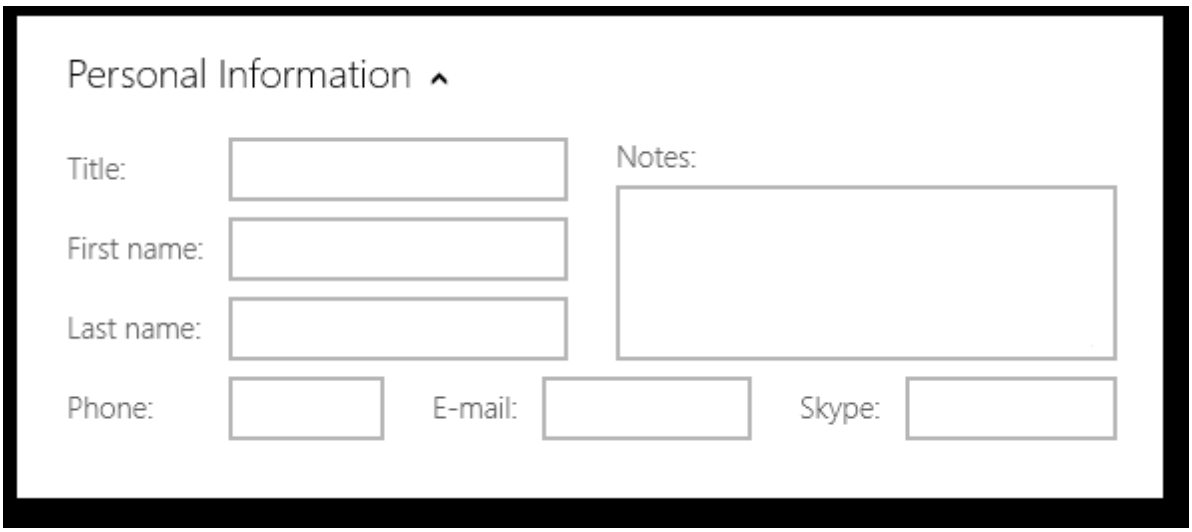
Examples

How to: Create Layout of Controls Within Form

The following code creates a LayoutControl with nested LayoutGroups. Item arrangement within the groups is controlled by the LayoutGroupBase.Orientation property:



Xaml

```
xmlns:Layout="using:DevExpress.UI.Xaml.Layout"
xmlns:Editors="using:DevExpress.UI.Xaml.Editors"
<Layout:LayoutControl  Width="550">
    <Layout:LayoutGroup Orientation="Vertical" Header="Personal Information" AllowExpand="True">
        <Layout:LayoutGroup Orientation="Horizontal">
            <Layout:LayoutGroup Orientation="Vertical">
                <Layout:LayoutItem Header="Title:"><Editors:TextEdit/></Layout:LayoutItem>
                <Layout:LayoutItem Header="First name:"><Editors:TextEdit/></Layout:LayoutItem>
                <Layout:LayoutItem Header="Last name:"><Editors:TextEdit/></Layout:LayoutItem>
            </Layout:LayoutGroup>
            <Layout:LayoutItem HeaderPosition="Top" Header="Notes:"><Editors:TextEdit/></Layout:LayoutIter
        </Layout:LayoutGroup>
        <Layout:LayoutGroup Orientation="Horizontal">
            <Layout:LayoutItem Header="Phone:"><Editors:TextEdit/></Layout:LayoutItem>
            <Layout:LayoutItem Header="E-mail:"><Editors:TextEdit/></Layout:LayoutItem>
            <Layout:LayoutItem Header="Skype:"><Editors:TextEdit/></Layout:LayoutItem>
        </Layout:LayoutGroup>
    </Layout:LayoutGroup>
</Layout:LayoutControl>
```

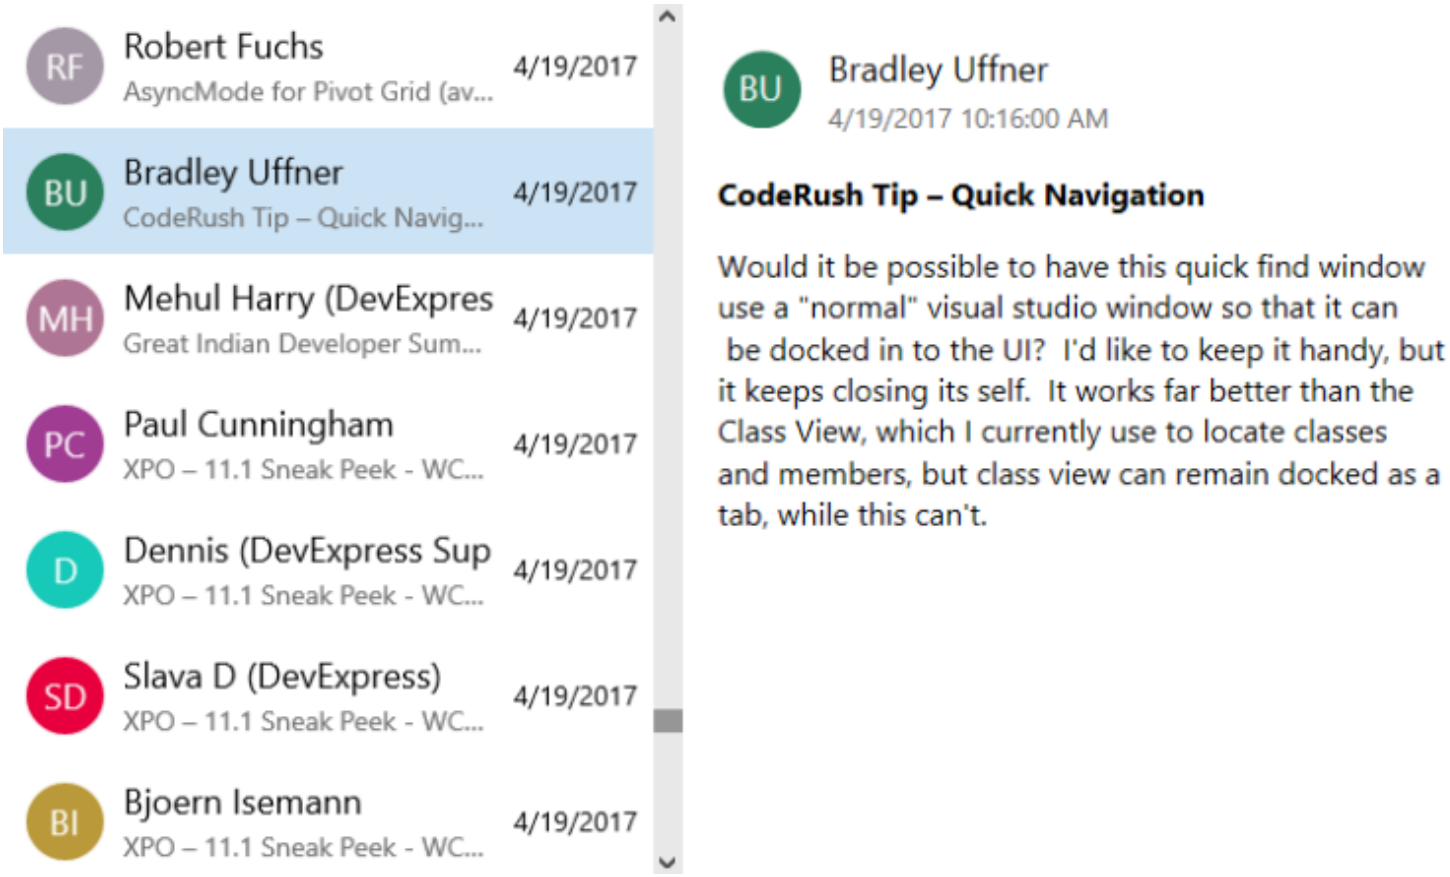
Master-Detail Pattern

Windows 10 App Controls > Controls > Navigation and Layout > Master-Detail Pattern

The DevExpress Master-Detail Pattern represents a navigation control that consists of a master pane and a details pane. Selecting an item in the master pane updates the content in the details pane.



To implement the Master-Detail Pattern in your application, use the MasterDetailPageContent control. To specify the master pane content, use the MasterDetailPageContent.MasterPane property. The details pane content is set using the MasterDetailPageContent**.Content** property (in XAML, set the content directly between the MasterDetailPageContent start and end tags).

Display Modes

The Master-Detail Pattern supports two display modes:

- Side by side - both the master and detail panes are shown simultaneously.
- Stacked - the master pane takes all the available space. When a selection is made, the detail pane gets all the available space.

The MasterDetailPageContent.ViewState property specifies the current display mode.

Adaptive Layout

The Master-Detail Pattern is able to automatically change its display mode based on its current width. This behavior is regulated by the MasterDetailPageContent.EnableAdaptiveLayout property.

The MasterDetailPageContent.StackedStateThreshold property specifies the width, in pixels, at which the Stacked display mode is automatically enabled.

Example

Ribbon Control

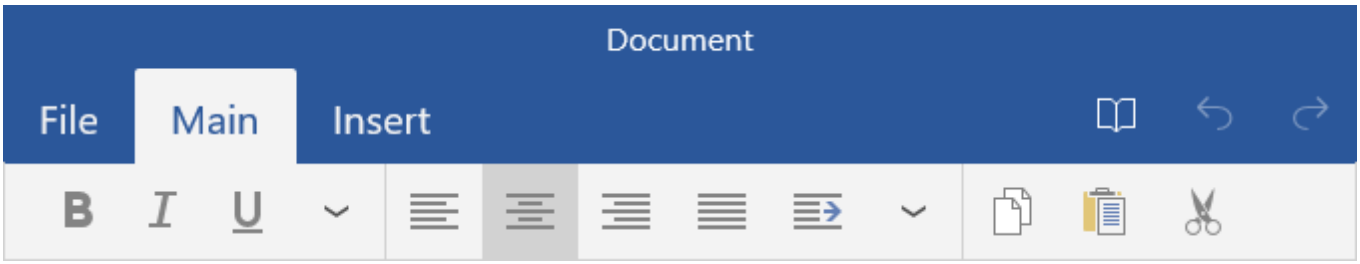
Windows 10 App Controls > Controls > Navigation and Layout > Ribbon Control

The Ribbon Control is represented by the RibbonControl class. It implements the Ribbon UI that provides a light, modern and sharper looking way to organize application menus by grouping menu items into separate Tabs and Groups.

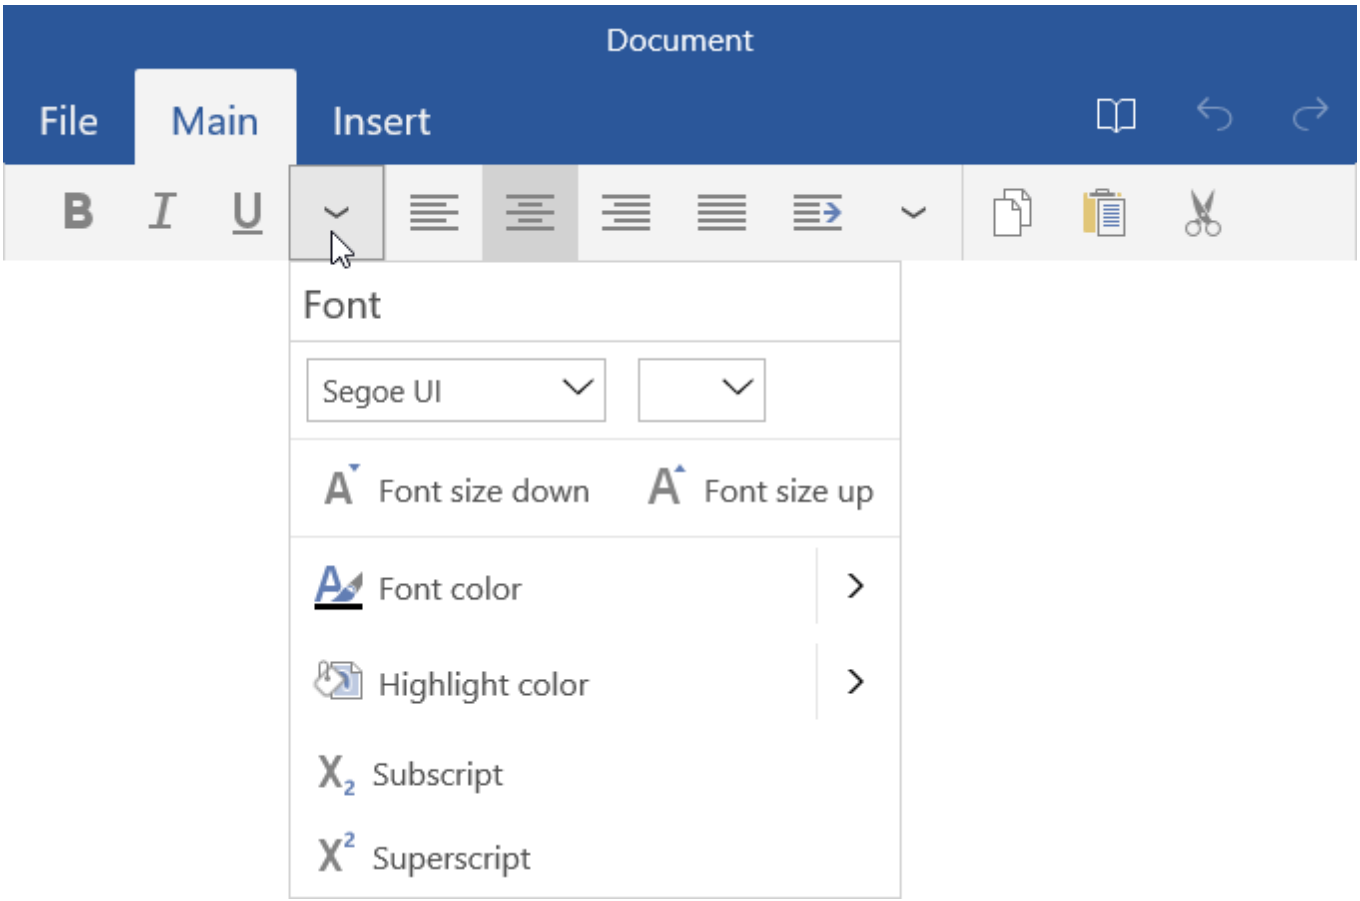
Most commonly used items can be shown in a Help Pane, so that they are always available to an end-user regardless of what tab is currently active. A root application menu and settings are represented by the Backstage View. The RibbonControl has a different layout in desktop and mobile applications and supports adaptive layout - items are hidden into a flyout and shown the in control depending on the available space.

The Ribbon And Toolbar Items document provides information about items that can be used in Ribbon and Toolbar controls.

The following screenshot shows a sample RibbonControl which contains two pages ("Main" and "Insert"). The first page has three groups delimited by vertical separators, and each group contains specific items.



Group captions are hidden from the Ribbon bar and are only displayed in flyouts that provide access to collapsed Ribbon buttons. In the image below, the flyout for the Font group is invoked:

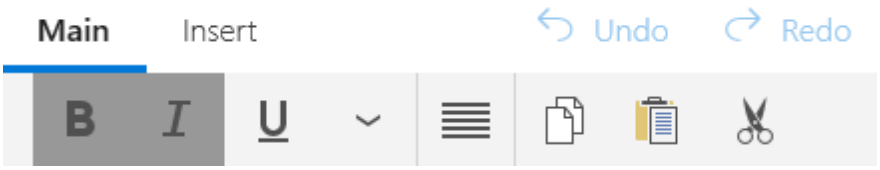


The Ribbon control supports auto-hide mode, in which the Ribbon's title (see RibbonControl.Title) is only initially visible.

© 2018 Developer Express Inc.

An end-user can click the title to expand the collapsed Ribbon control. See the RibbonControlBase.ViewMode property for more information.

The RibbonToolbarControl provides a similar to Ribbon Control capabilities to organize your application menus by grouping your commands into separate tabs and groups. This control provides lighter layout and in comparison to Ribbon Control does not contain a title, root application menu, and contextual tabs.



The ToolbarControl is a lightweight one-tab toolbar control.

Visual Elements

Windows 10 App Controls > Controls > Navigation and Layout > Ribbon Control > Visual Elements

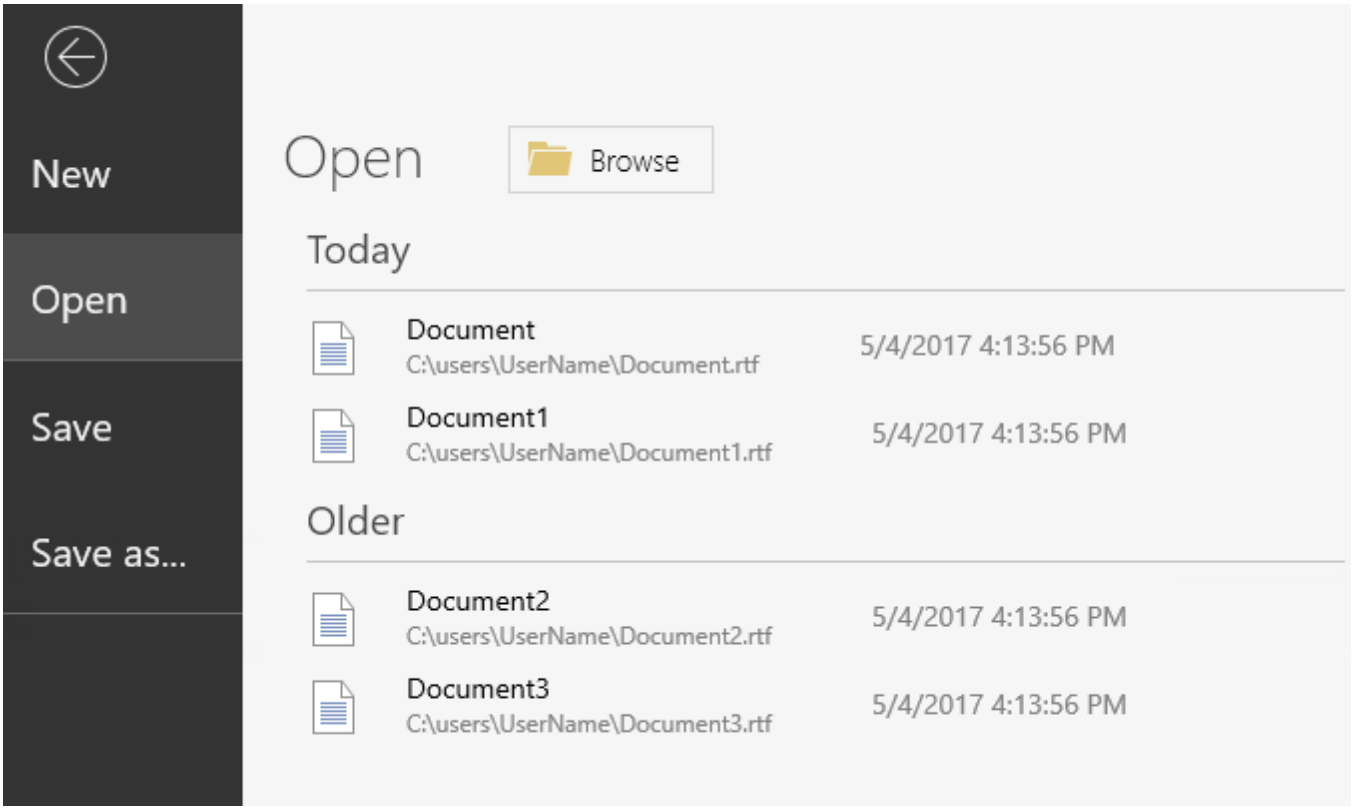
Topics in this section:

- Backstage View
- Tabs and Groups
- Help Pane

© 2018 Developer Express Inc.

Backstage View

The **Backstage View** is represented by the BackstageView control. It emulates the menu in the MS Office Ribbon UI.



The Backstage View's general structure consists of two areas. The left one - the Content Area - holds all backstage menu items. The right area - the Control Pane - displays the content of the currently selected tab item.

You can use the following item types within a Backstage View: a regular button, tab item and separator item.

- A BackstageButtonItem is a regular button item. There are two ways of specifying which actions a button item will perform - using the **Click** or **Tapped** event or attaching an ICommand object to a button via the **Command** property.
- A BackstageTabItem acts as a tab item in a tab control: as the end-user clicks its caption (displayed in the Content Area), its contents are displayed in the Control Pane area. In the image above, the Control Pane area displays the selected *'Open'* tab item contents - the list of documents that can be opened.
- A BackstageSeparatorItem is a line that visually separates two neighboring elements. Use it to create visually detach item groups to improve a menu's visual perception and readability.

To attach a Backstage View to a RibbonControl, assign a BackstageView to the RibbonControl.BackstageView property. See the example below.

Xaml	

© 2018 Developer Express Inc.

```
<Ribbon:RibbonControl.BackstageView>
    <Ribbon:BackstageView Caption="File" IsOpen="{Binding IsBackstageOpen, Mode=TwoWay}">
        <Ribbon:BackstageTabItem Content="New">
            <local:NewFileBackstageView dxmvvm:ViewModelExtensions.ParentViewModel="{Binding DataContext,
        </Ribbon:BackstageTabItem>
        <Ribbon:BackstageTabItem Content="Open">
            <local:OpenFileBackstageView dxmvvm:ViewModelExtensions.ParentViewModel="{Binding DataContext,
        </Ribbon:BackstageTabItem>
        <Ribbon:BackstageSeparatorItem />
        <Ribbon:BackstageButtonItem Content="Save" Command="{Binding SaveFileCommand}" CommandParameter="
        <Ribbon:BackstageButtonItem Content="Save as..." Command="{Binding SaveFileCommand}" CommandParame
        <Ribbon:BackstageSeparatorItem />
    </Ribbon:BackstageView>
</Ribbon:RibbonControl.BackstageView>
```

A Backstage View attached to the RibbonControl will be shown after a user clicks the associated leftmost tab item.

© 2018 Developer Express Inc.

Tabs and Groups

Windows 10 App Controls > Controls > Navigation and Layout > Ribbon Control > Visual Elements > Tabs and Groups

Ribbon tabs are represented by RibbonTab class instances. They are structurally and visually split into groups that display various commands, static items, editors and galleries. Groups are represented by RibbonGroup class instances. The Ribbon And Toolbar Items document lists available Ribbon items.

To get the collection of RibbonControl's tabs, use the RibbonControl.Tabs property. The RibbonTab.Groups property provides access to groups within a tab. Group items are available via the RibbonGroup.Items property.

The example below illustrates how to create a ribbon tab with font settings split into two groups.

Xaml

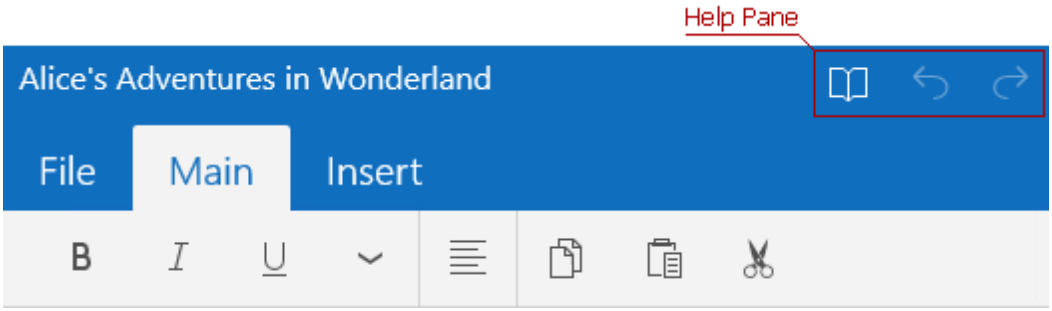
```
<Ribbon:RibbonControl>
    <Ribbon:RibbonTab Caption="Font">
        <Ribbon:RibbonGroup>
            <Ribbon:RibbonFontEdit />
        </Ribbon:RibbonGroup>
        <Ribbon:RibbonGroup>
            <Ribbon:RibbonButton>
                <Ribbon:RibbonButton.Icon>
                    <SymbolIcon Symbol="Bold" />
                </Ribbon:RibbonButton.Icon>
            </Ribbon:RibbonButton>
            <Ribbon:RibbonButton>
                <Ribbon:RibbonButton.Icon>
                    <SymbolIcon Symbol="Italic" />
                </Ribbon:RibbonButton.Icon>
            </Ribbon:RibbonButton>
            <Ribbon:RibbonButton>
                <Ribbon:RibbonButton.Icon>
                    <SymbolIcon Symbol="Underline" />
                </Ribbon:RibbonButton.Icon>
            </Ribbon:RibbonButton>
        </Ribbon:RibbonGroup>
    </Ribbon:RibbonTab>
<Ribbon:RibbonControl>
```

© 2018 Developer Express Inc.

Help Pane

Windows 10 App Controls > Controls > Navigation and Layout > Ribbon Control > Visual Elements > Help Pane

Help Pane is represented by the HelpPane class. It is located on the top-right side above the Ribbon Tabs content. The Help Pane is shown regardless of what Ribbon Tab is currently selected.



You can use regular, radio and toggle buttons within a Help Pane. The **Icon** property specifies the icon displayed by the button. The **Content** property specifies the button tooltip. There are two ways of specifying which actions a button item will perform - using the **Click** or **Tapped** event or attaching an ICommand object to a button via the **Command** property.

To attach a Help Pane to a RibbonControl, assign a HelpPane instance to the RibbonControl.HelpPane property. See the example below.

Xaml

```
<Ribbon:RibbonControl.HelpPane>
    <Ribbon:HelpPane>
            <Ribbon:HelpPaneButton Content="Save Changes" Command="{Binding SaveChangesCommand}">
                <Ribbon:HelpPaneButton.Icon>
                    <SymbolIcon Symbol="Save" />
                </Ribbon:HelpPaneButton.Icon>
            </Ribbon:HelpPaneButton>
            <Ribbon:HelpPaneToggleButton Content="Toggle Edit Mode" Command="{Binding ToggleEditModeCommar
                <Ribbon:HelpPaneToggleButton.Icon>
                    <SymbolIcon Symbol="Save" />
                </Ribbon:HelpPaneToggleButton.Icon>
            </Ribbon:HelpPaneToggleButton>
    </Ribbon:HelpPane>
</Ribbon:RibbonControl.HelpPane>
```

© 2018 Developer Express Inc.

Ribbon And Toolbar Items

The table below provides the information about items that can be used in our Windows 10 Apps Ribbon and Toolbar controls. Items in different controls have different names, but provide a similar functionality.

Item	Image	In Ribbon Control	In RibbonToolbarControl	In ToolbarControl	In ContextToolbarControl	Description
Button		RibbonButton	RibbonToolbarButton	ToolbarButton	ContextToolbarButton	A regular button. Specify the icon displayed within the button using **Icon** property.
CheckBox		RibbonCheckBox	RibbonToolbarCheckBox	-	-	A checkbox button that allows users to select between two (checked and unchecked) states.

© 2018 Developer Express Inc.

						Set the **IsThreeState** property to **true** to enable the third (indeterminate) check state.
ColorEdit		RibbonColorEdit	RibbonToolbarColorEdit	-	-	Enables end-users to select a predefined color or pick any color using the RGB color model.

ComboBox		RibbonComboBox	RibbonToolbarComboBox	-	-	Allows end-users to select predefined items from a drop down list.
FontEdit		RibbonFontEdit	RibbonToolbarFontEdit	-	-	Allows end-users to specify the font settings.
Gallery		RibbonGallery	RibbonToolbarGallery	-	-	Displays a list of gallery items within a Ribbon or in a drop down and provides menu functionality.
RadioButton		RibbonRadioButton	RibbonToolbarRadioButton	ToolbarRadioButton	ContextToolbarRadioButton	Represents a button that can be

© 2018 Developer Express Inc.

						selected by the end-user. Paired with other radio buttons, enables end-users to select a single option from a group of choices.
Spin Edit		RibbonSpinEdit	RibbonToolbarSpinEdit	-	-	Enables your end-users to edit numeric values by typing and using spin buttons.

© 2018 Developer Express Inc.

SplitButton		RibbonSplitButton	RibbonToolbarSplitButton	Toolbar Split Button	Context Toolbar Split Button	Consists of two buttons: a regular button and a dropdown button that invokes a flyout.
TextBox		RibbonTextBox	RibbonToolbarTextBox	-	-	A regular text editor.
ToggleButton		RibbonToggleButton	RibbonToolbarToggleButton	ToolbarToggleButton	ContextToolbarToggleButton	Allows end-users to switch between two states. Set the **IsThreeState** property to **true** to enable the third (indeterminate) state.

Data Editors

Windows 10 App Controls > Controls > Data Editors

Create compelling Universal Windows Platform business solutions that deliver on the touch-first promise with all the power to shape and manipulate data as end-user needs dictate. The high-performance DevExpress Data Grid and Data Editors exploit the power inherent in Windows 10 without limiting traditional features you've come to expect from a powerful Grid and Data Editors library.

Getting Started

Topics in this section:

- Lesson 1 - Creating a TextEdit With a Custom Button

In this tutorial, you will learn how to create and customize the TextEdit.

- Lesson 2 - Enabling the Masked Input for a TextEdit

In this tutorial, you will learn how to enable the masked input for the TextEdit.

- Lesson 3 - Creating a TextEdit with a Dropdown

In this tutorial, you will learn how to create the dropdown for the TextEdit.

- Lesson 4 - Creating a RangeControl

In this tutorial, you will learn how to create and customize the RangeControl.

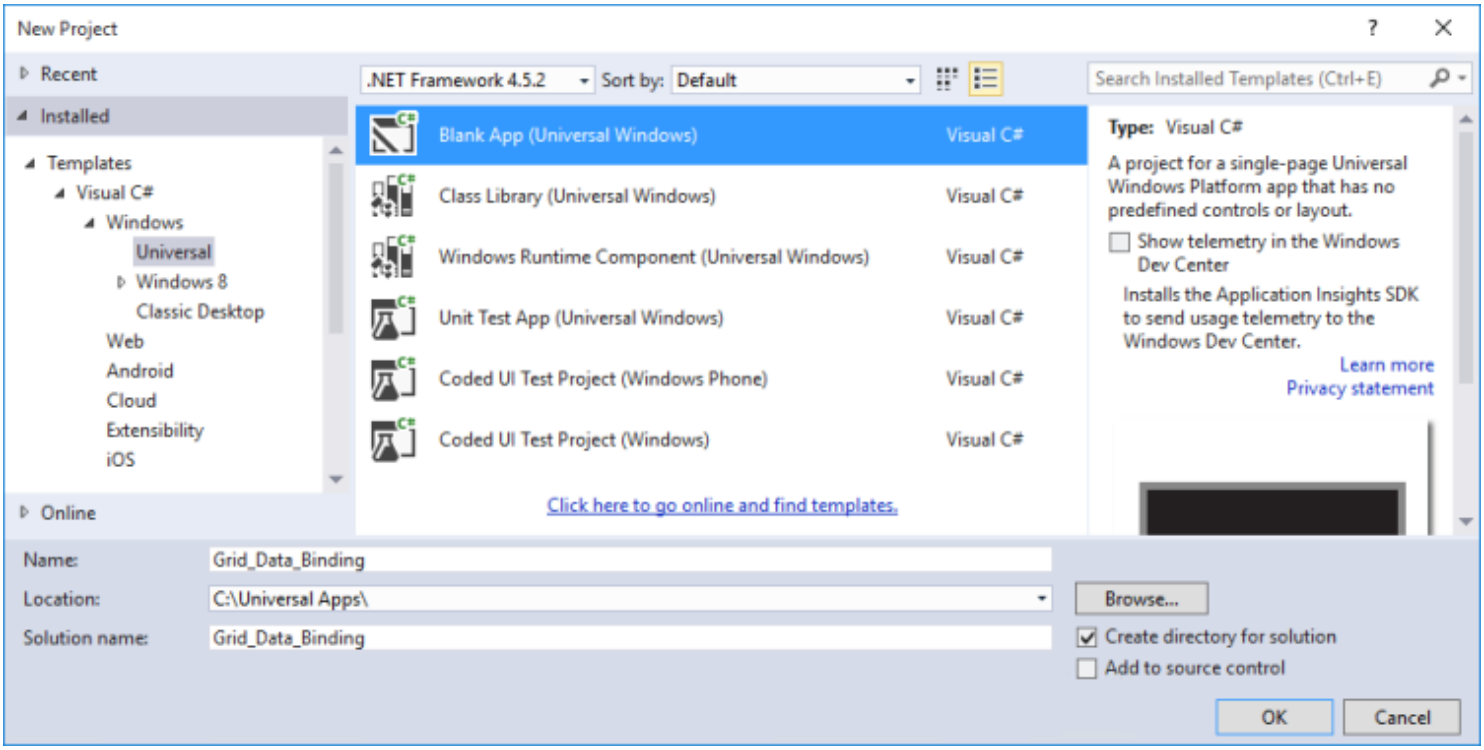
© 2018 Developer Express Inc.

Lesson 1 - Creating a TextEdit With a Custom Button

This document demonstrates how to create and customize the TextEdit.

Do the following:

1. Run MS Visual Studio 2015.
2. Create a new Windows Universal Application project. Choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose the **Windows Universal** template category, and then choose **Blank App (XAML)**.



3. Open the Visual Studio toolbox, locate the "DX.18.1: Common Controls" tab, choose the **TextEdit** toolbox item and drop it onto the window.

Note

Dropping the **TextEdit** toolbox item onto the window will automatically add all the required references (DevExpress.Core and DevExpress.Controls). To add the **TextEdit** in code, reference these assemblies manually.

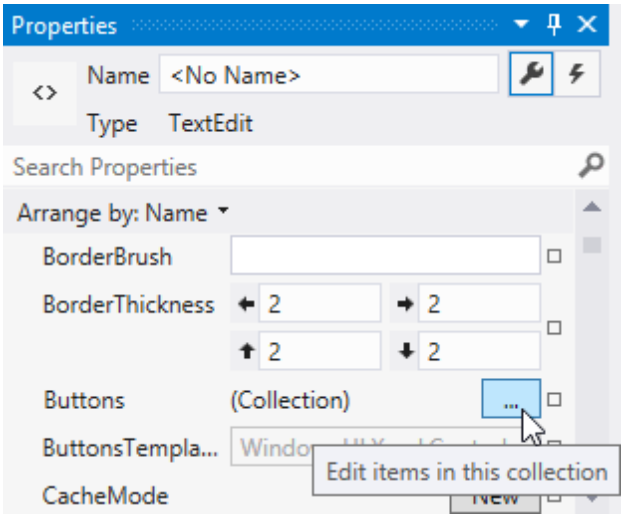
4. Press the **F4** key to invoke the **Properties** window. Position the **TextEdit** in the center of the screen by setting its **HorizontalAlignment** and **VerticalAlignment** properties to **Center**. Set the editor's **Width** property to **300**. Set the **Name** property to "textEdit" and the **Text** property to "TextEdit".

Xaml

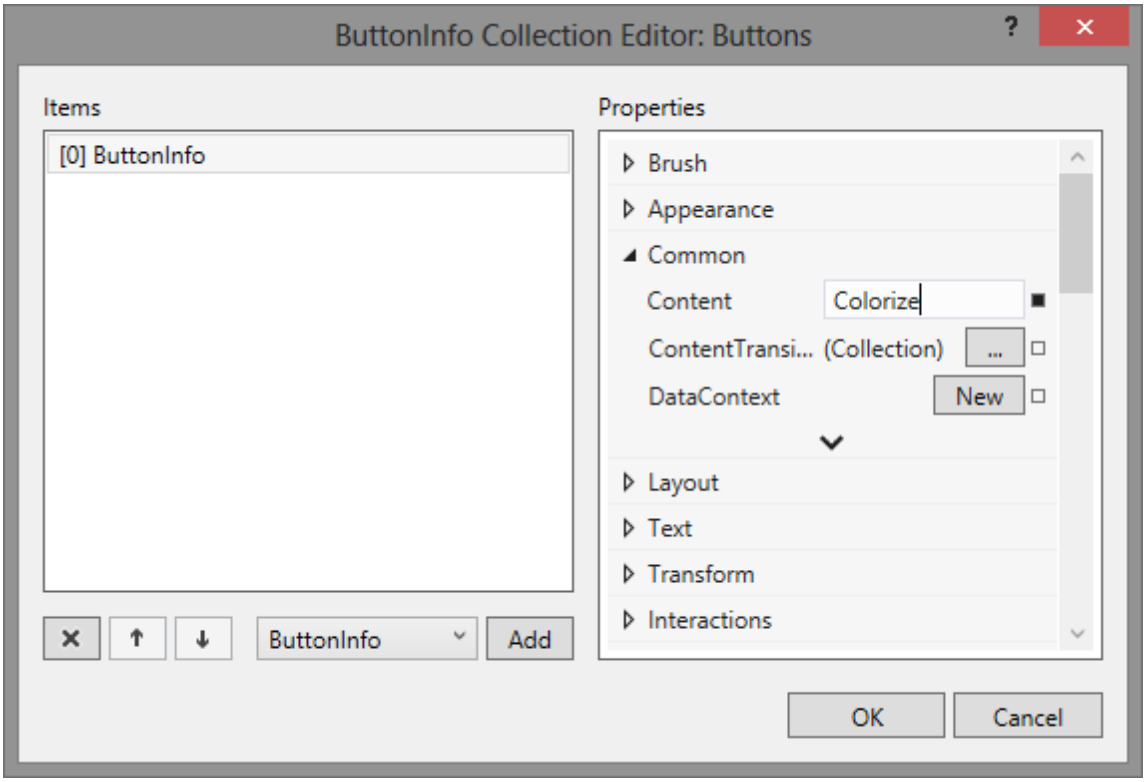
```
<Editors:TextEdit Name="textEdit" Text="TextEdit" HorizontalAlignment="Center" VerticalAlignment="Center"
```

5. Locate the **Buttons** property. Invoke **Collection Editor: Buttons**.

© 2018 Developer Express Inc.



6. In the **Collection Editor**, add a **ButtonInfo** item. Set the **Content** property to "Colorize" and **IsLeft** property to **true**.



7. Handle the **Click** event of the "Colorize" button to change the editor's foreground color.

Xaml

© 2018 Developer Express Inc.

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:Text_Edit"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Editors="using:DevExpress.UI.Xaml.Editors"
    x:Class="Text_Edit.MainPage"
    mc:Ignorable="d">
    <Grid >
        <Editors:TextEdit Name="textEdit" Text="TextEdit" HorizontalAlignment="Center" VerticalAlignment="
            <Editors:TextEdit.Buttons>
                <Editors:ButtonInfo Content="Colorize" IsLeft="True" Click="ButtonInfo_Click"/>
            </Editors:TextEdit.Buttons>
        </Editors:TextEdit>
    </Grid>
</Page>
```

C#

```
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Media;
namespace Text_Edit {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
        }
        private void ButtonInfo_Click(object sender, EventArgs e) {
            Random random = new Random();
            Windows.UI.Color randomColor = Windows.UI.Color.FromArgb(255, (byte)random.Next(20, 255), (byt
            textEdit.Foreground = new SolidColorBrush(randomColor);
        }
    }
}
```

8. Run the application to see the result.

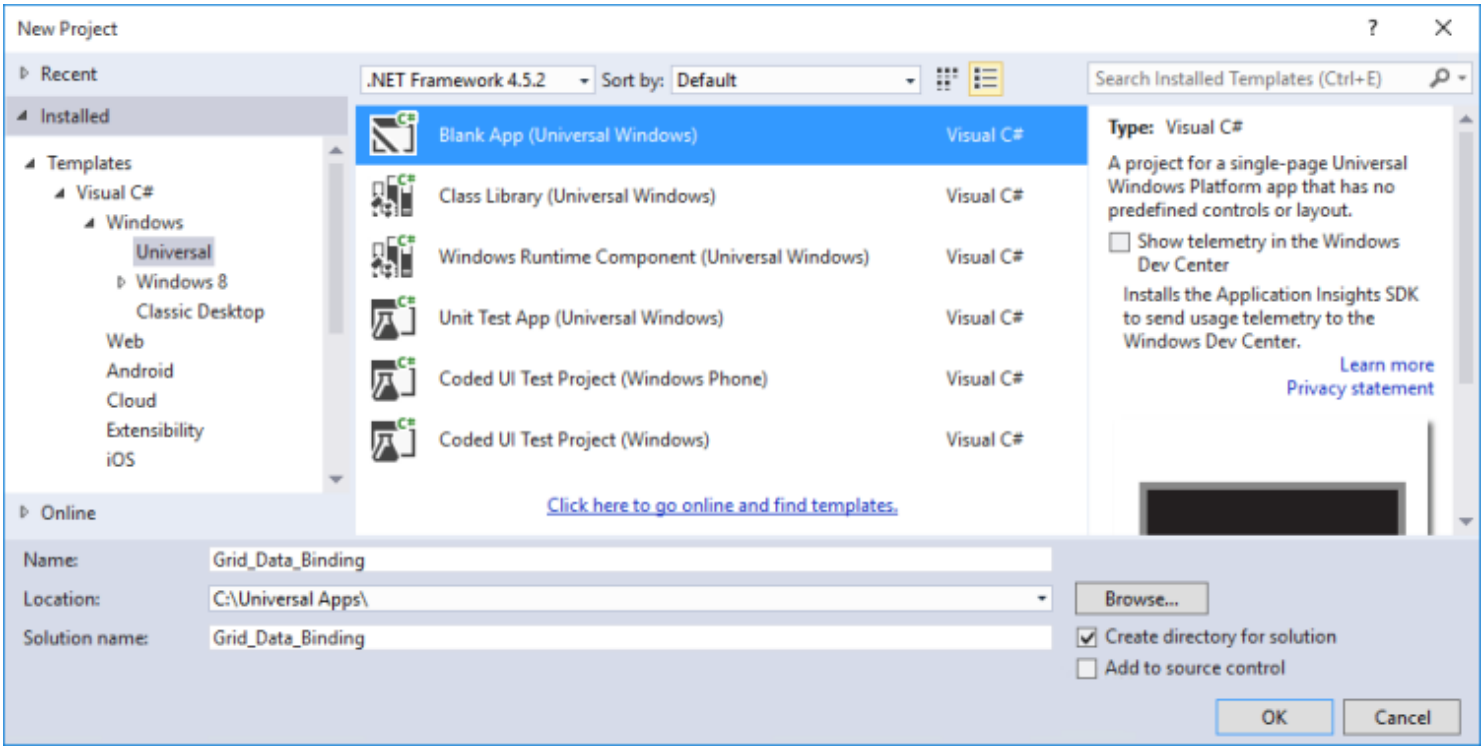
© 2018 Developer Express Inc.

Lesson 2 - Enabling the Masked Input for a TextEdit

This document demonstrates how to create a TextEdit control and specify a phone mask.

Follow these steps.

1. Run MS Visual Studio 2015.
2. Create a new Windows Universal Application project. Choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose the **Windows Universal** template category, and then choose **Blank App (XAML)**.



3. Open the Visual Studio toolbox, locate the "DX.18.1: Common Controls" tab, choose the **TextEdit** toolbox item and drop it onto the window.

Note

Dropping the **TextEdit** toolbox item on the window will automatically add all the required references (DevExpress.Core and DevExpress.Controls). To add the **TextEdit** in code, reference these assemblies manually.

4. Press the **F4** key to invoke the **Properties** window. Position the **TextEdit** in the center of the screen by setting its **HorizontalAlignment** and **VerticalAlignment** properties to **Center**. Set the editor's **Width** property to **300**.

Xaml

```
<Editors:TextEdit HorizontalAlignment="Center" VerticalAlignment="Center" Width="300"/>
```

5. Locate the **TextInputSettings** property. Press the **New** button to invoke the **Select Object** dialog window. Select **TextInputMaskSettings** and press **OK**.

Xaml

```
<Editors:TextEdit HorizontalAlignment="Center" VerticalAlignment="Center" Width="300" >
    <Editors:TextEdit.TextInputSettings>
        <Editors:TextInputMaskSettings/>
    </Editors:TextEdit.TextInputSettings>
</Editors:TextEdit>
```

6. Specify the mask. The following code shows how to specify the **RegEx** type phone mask in XAML.

Xaml

© 2018 Developer Express Inc.

```
<Editors:TextEdit HorizontalAlignment="Center" VerticalAlignment="Center" Width="300" >
    <Editors:TextEdit.TextInputSettings>
        <Editors:TextInputMaskSettings MaskType="RegEx" Mask="((\+\d)?\(\d{3}\))?\d{3}-\d\d-\d\d" />
    </Editors:TextEdit.TextInputSettings>
</Editors:TextEdit>
```

The image below shows the result.

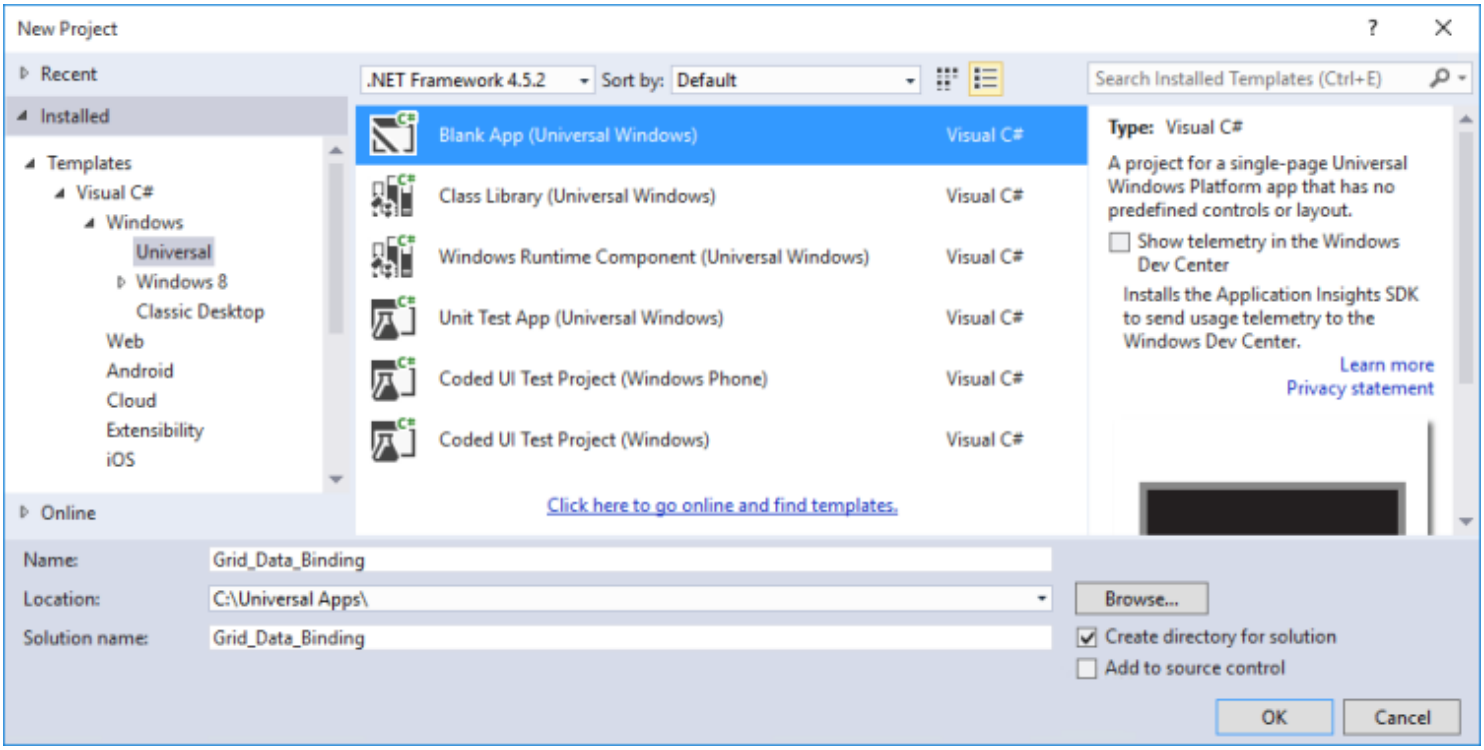
© 2018 Developer Express Inc.

Lesson 3 - Creating a TextEdit with a Dropdown

This document demonstrates how to create a TextEdit control with a custom dropdown.

Follow these steps.

1. Run MS Visual Studio 2015.
2. Create a new Windows Universal Application project. Choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose the **Windows Universal** template category, and then choose **Blank App (XAML)**.



3. Open the Visual Studio toolbox, locate the "DX.18.1: Common Controls" tab, choose the **TextEdit** toolbox item and drop it onto the window.

Note

Dropping the **TextEdit** toolbox item onto the window will automatically add all the required references (DevExpress.Core and DevExpress.Controls). To add the **TextEdit** in code, reference these assemblies manually.

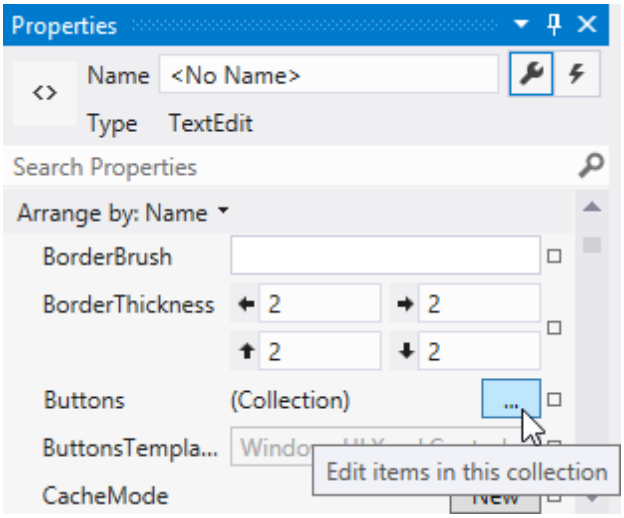
4. Press the **F4** key to invoke the **Properties** window. Position the **TextEdit** in the center of the screen by setting its **HorizontalAlignment** and **VerticalAlignment** properties to **Center**. Set the editor's **Width** property to **300**. Set the **Name** property to "textEdit".

Xaml

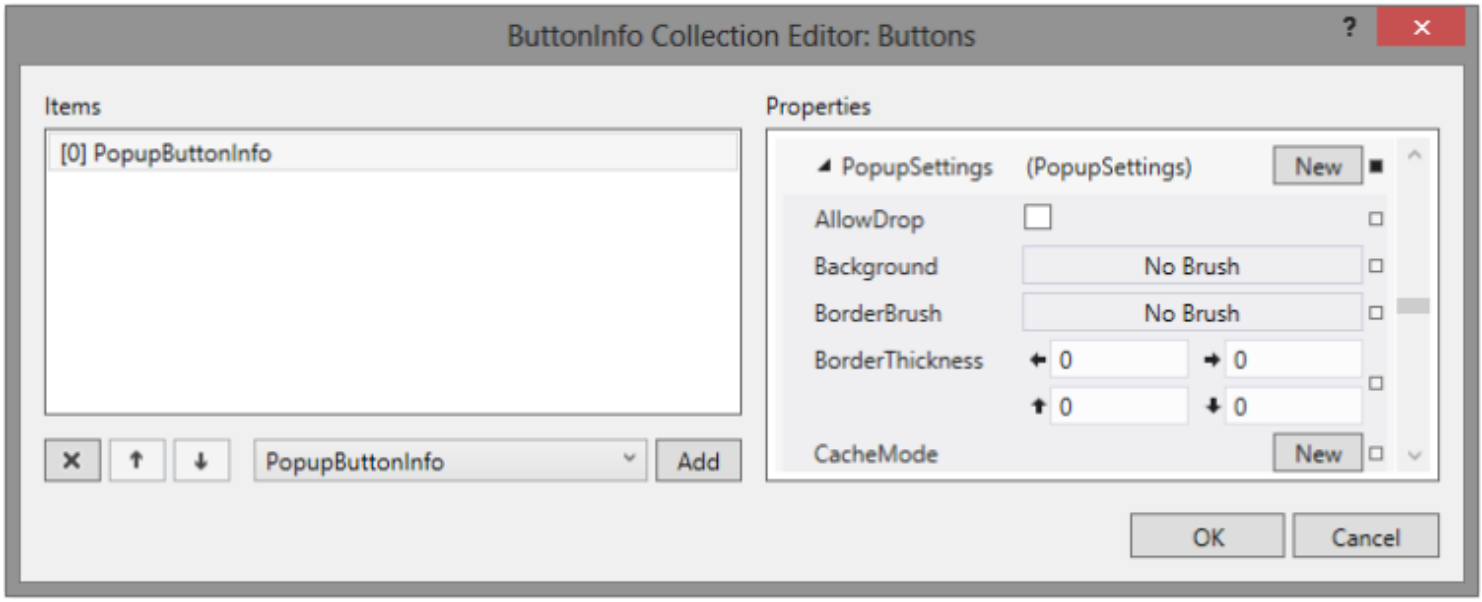
```
<Editors:TextEdit Name=""textEdit" HorizontalAlignment="Center" VerticalAlignment="Center" Width="300"/>
```

5. Locate the **Buttons** property. Invoke **Collection Editor: Buttons**.

© 2018 Developer Express Inc.



6. In the **Collection Editor**, select **Other type** from the dropdown menu to invoke the **Select Object** dialog window. Select **PopupButtonInfo** and press **OK**. Add a **PopupButtonInfo** object and set its **PopupSettings** property to **PopupSettings**.

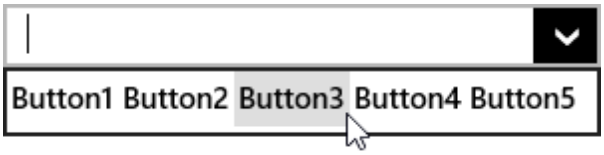


7. Specify the popup content. The following code shows how to set a **ButtonsControl** with five buttons as the dropdown content in XAML.

Xaml

```
<Editors:TextEdit Name="textEdit" HorizontalAlignment="Center" VerticalAlignment="Center" Width="300">
    <Editors:TextEdit.Buttons>
        <Editors:PopupButtonInfo>
            <Editors:PopupButtonInfo.PopupSettings>
                <Editors:PopupSettings PopupAutoWidth="True" PopupMaxHeight="200">
                    <Editors:PopupSettings.PopupContent>
                        <Editors:ButtonsControl>
                            <Editors:ButtonsControl.Items>
                                <Editors:ButtonInfo Content="Button1" />
                                <Editors:ButtonInfo Content="Button2" />
                                <Editors:ButtonInfo Content="Button3" />
                                <Editors:ButtonInfo Content="Button4" />
                                <Editors:ButtonInfo Content="Button5" />
                            </Editors:ButtonsControl.Items>
                        </Editors:ButtonsControl>
                    </Editors:PopupSettings.PopupContent>
                </Editors:PopupSettings>
            </Editors:PopupButtonInfo.PopupSettings>
        </Editors:PopupButtonInfo>
    </Editors:TextEdit.Buttons>
</Editors:TextEdit>
```

8. Run the application to see the result.



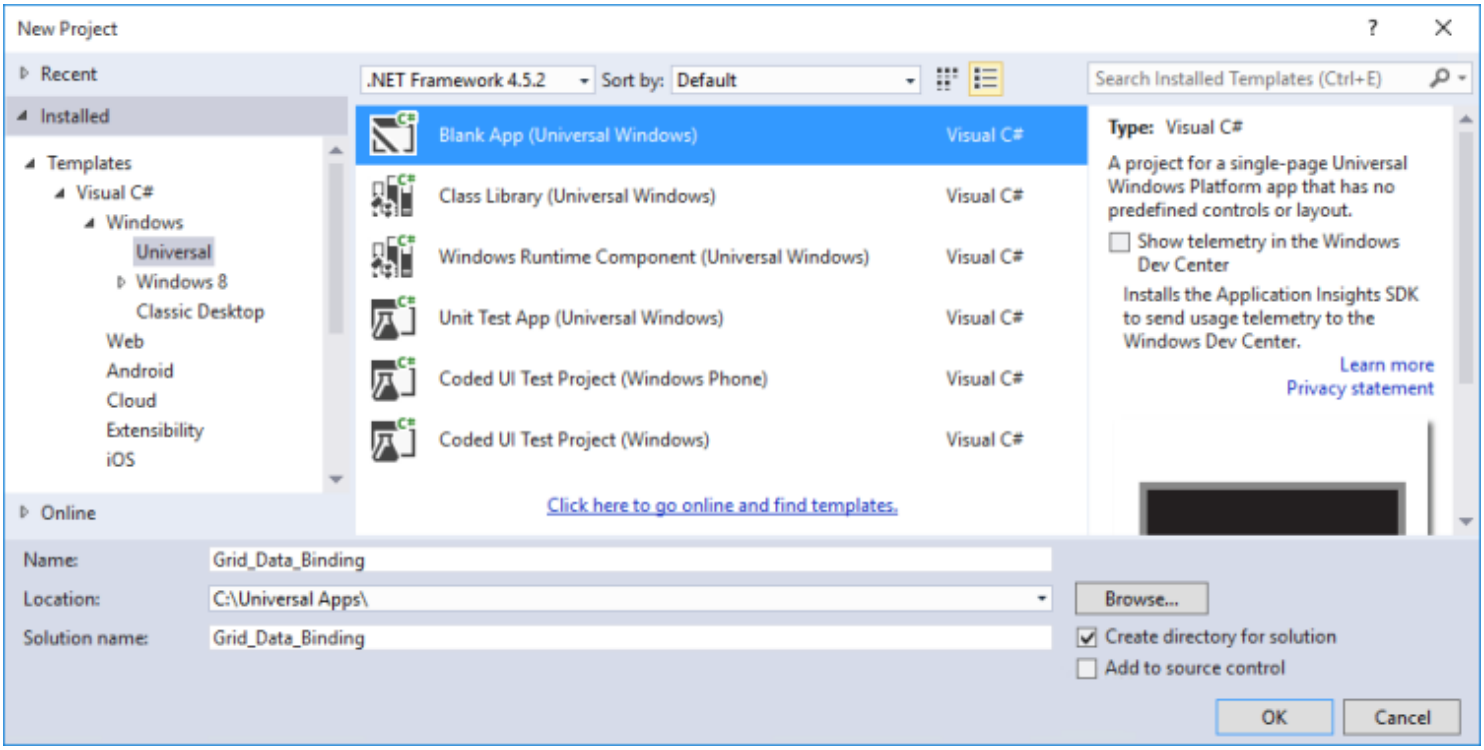
© 2018 Developer Express Inc.

Lesson 4 - Creating a RangeControl

This document demonstrates how to create a RangeControl and bind it to data.

Follow these steps.

1. Run MS Visual Studio 2015.
2. Create a new Windows Universal Application project. Choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose the **Windows Universal** template category, and then choose **Blank App (XAML)**.



3. Open the **MainPage.xaml.cs** file and add data classes. In XAML, set **DataContext**:

Xaml

```
<Grid>
    <Grid.DataContext>
        <local:DateTimeViewModel Count="1000" Step="06:00:00" Start="10000" />
    </Grid.DataContext>
</Grid>
```

C#

© 2018 Developer Express Inc.

```
using System;
using System.Collections;
using System.Collections.Generic;
using Windows.UI.Xaml.Controls;
namespace RangeControl_example {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
        }
    }
    public class DateTimeViewModel {
        public int Count { get; set; }
        public double Start { get; set; }
        IEnumerable itemsSource;
        public IEnumerable ItemsSource { get { return itemsSource ?? (itemsSource = CreateItemsSource(Cou
        protected double GenerateStartValue(Random random) {
            return Start + random.NextDouble() * 100;
        }
        protected double GenerateAddition(Random random) {
            double factor = random.NextDouble();
            if (factor == 1)
                factor = 50;
            else if (factor == 0)
                factor = -50;
            return (factor - 0.5) * 50;
        }
        readonly Random random = new Random();
        DateTime start = new DateTime(2000, 1, 1);
        public TimeSpan Step { get; set; }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { Value = start, DisplayValue = value });
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;
                points.Add(new DateTimeDataPoint() { Value = start, DisplayValue = value });
            }
            return points;
        }
    }
    public class NumericDataPoint {
        public int Value { get; set; }
        public double DisplayValue { get; set; }
    }
    public class DateTimeDataPoint {
        public DateTime Value { get; set; }
        public double DisplayValue { get; set; }
    }
}
```

4. Open the Visual Studio toolbox and locate the "DX.18.1: Common Controls" tab. Choose the **RangeControl** toolbox item and drop it onto the window.

Note

Dropping the **RangeControl** toolbox item onto the window will automatically add all of the required references (DevExpress.Core and DevExpress.Controls). To add the **RangeControl** in code, reference these assemblies manually.

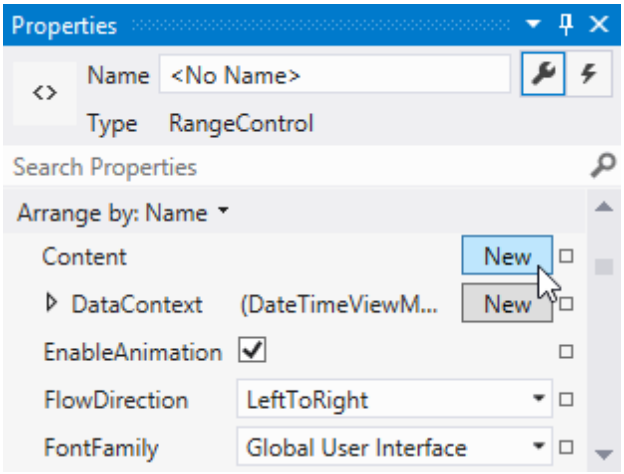
5. Right-click the **RangeControl** and select **Reset Layout** - **All**.
6. Press the **F4** key to invoke the **Properties** window. Set the editor's **ShowRangeThumbs** and **ShowRangeBar** properties to **true**.

Xaml

```
<Controls:RangeControl ShowRangeThumbs="True" ShowRangeBar="True"/>
```

7. Set the Range Control Client. Locate the **Content** property and press the **New** button to invoke a **SelectObject** dialog box.

© 2018 Developer Express Inc.



8. Select **SparkPointClient** and press **OK**.
9. Bind the Range Control Client to data using its **ItemsSource**, **ValueMember** and **DisplayMember** properties. The code below shows how to do it in XAML.

Xaml

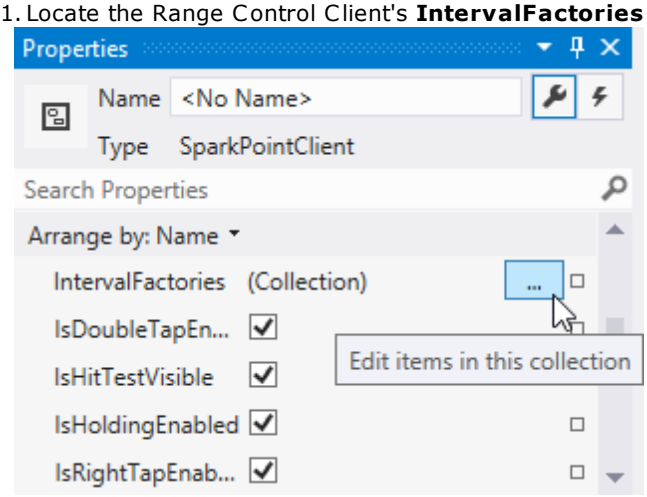
```
<Controls:RangeControl ShowRangeThumbs="True" ShowRangeBar="True">
    <Controls:SparkPointClient DisplayMember="DisplayValue" ValueMember="Value" ItemsSource="{Binding Path
</Controls:RangeControl>
```

10. Customize the Range Control Client. Set its **ValueScaleType** property to **DateTime** and the **DisplayScaleType** to **Numeric** to process data correctly. Set the **ShowAxisLabels**, **ShowAxisXGridLines** and **ShowAxisXMinorGridLines** properties to **true** to display the vertical axis.

Xaml

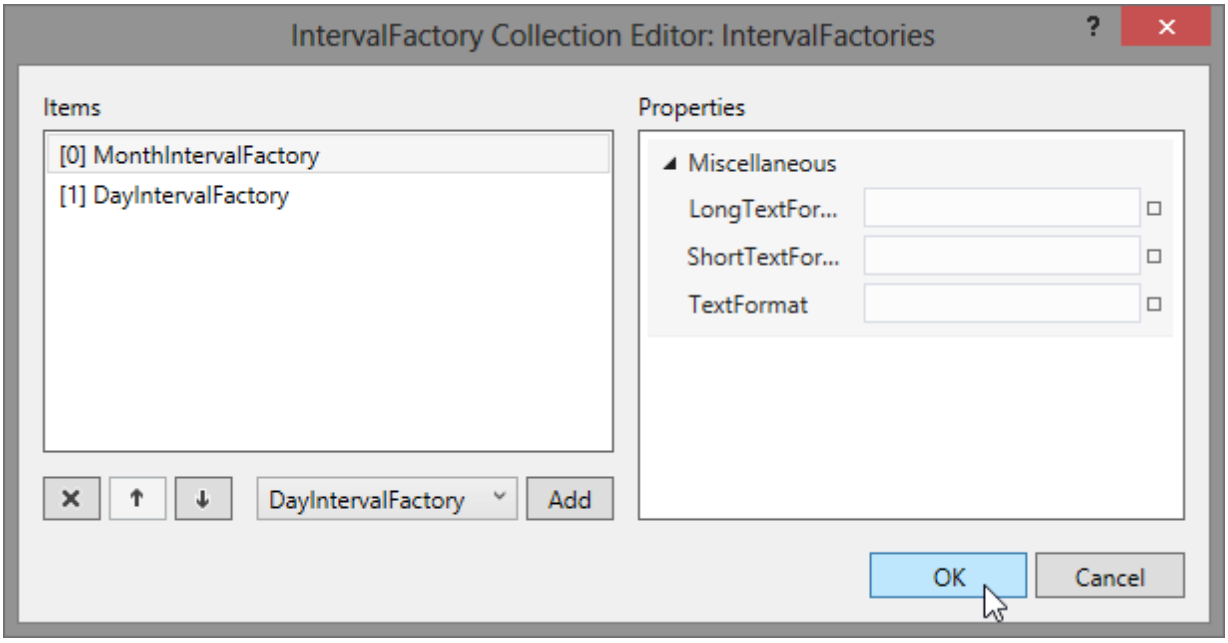
```
        <Controls:RangeControl ShowRangeThumbs="True" ShowRangeBar="True">
            <Controls:SparkPointClient
                            ShowAxisLabels="True"
                            ShowAxisXGridLines="True"
                            ShowAxisXMinorGridLines="True"
                            DisplayMember="DisplayValue"
                            ValueMember="Value"
                            DisplayScaleType="DateTime"
                            ValueScaleType="Numeric" ItemsSource="{Binding Path=ItemsSource}" >
            </Controls:SparkPointClient>
        </Controls:RangeControl>
```

11. Locate the Range Control Client's **IntervalFactories** property and invoke the **IntervalFactory Collection Editor**:



12. Add a **MonthIntervalFactory** and a **DayIntervalFactory** (to limit zooming) and press **OK**.

© 2018 Developer Express Inc.



The XAML should look like the following:

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:RangeControl_example"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Controls="using:DevExpress.UI.Xaml.Controls"
    x:Class="RangeControl_example.MainPage"
    mc:Ignorable="d">
    <Grid>
        <Grid.DataContext>
            <local:DateTimeViewModel Count="1000" Step="06:00:00" Start="10000" />
        </Grid.DataContext>
        <Controls:RangeControl ShowRangeThumbs="True" ShowRangeBar="True">
            <Controls:SparkPointClient
                            ShowAxisLabels="True"
                            ShowAxisXGridLines="True"
                            ShowAxisXMinorGridLines="True"
                            DisplayMember="DisplayValue"
                            ValueMember="Value"
                            DisplayScaleType="DateTime"
                            ValueScaleType="Numeric" ItemsSource="{Binding Path=ItemsSource}" >
                <Controls:SparkPointClient.IntervalFactories>
                    <Controls:MonthIntervalFactory/>
                    <Controls:DayIntervalFactory/>
                </Controls:SparkPointClient.IntervalFactories>
            </Controls:SparkPointClient>
        </Controls:RangeControl>
    </Grid>
</Page>
```

13. Run the example to see the result:

Editor Types

Windows 10 App Controls > Controls > Data Editors > Editor Types

Topics in this section:

- DateEdit
- DateNavigator
- Radial Time Picker
- RangeControl
- RatingEdit
- SpinEdit
- TextEdit

© 2018 Developer Express Inc.

DateEdit

This editor type is implemented by the DateEdit class. Its features include:

- Modern UI calendar views, allowing you to quickly select dates, months or years.
- The ability to limit date input to a predefined range.

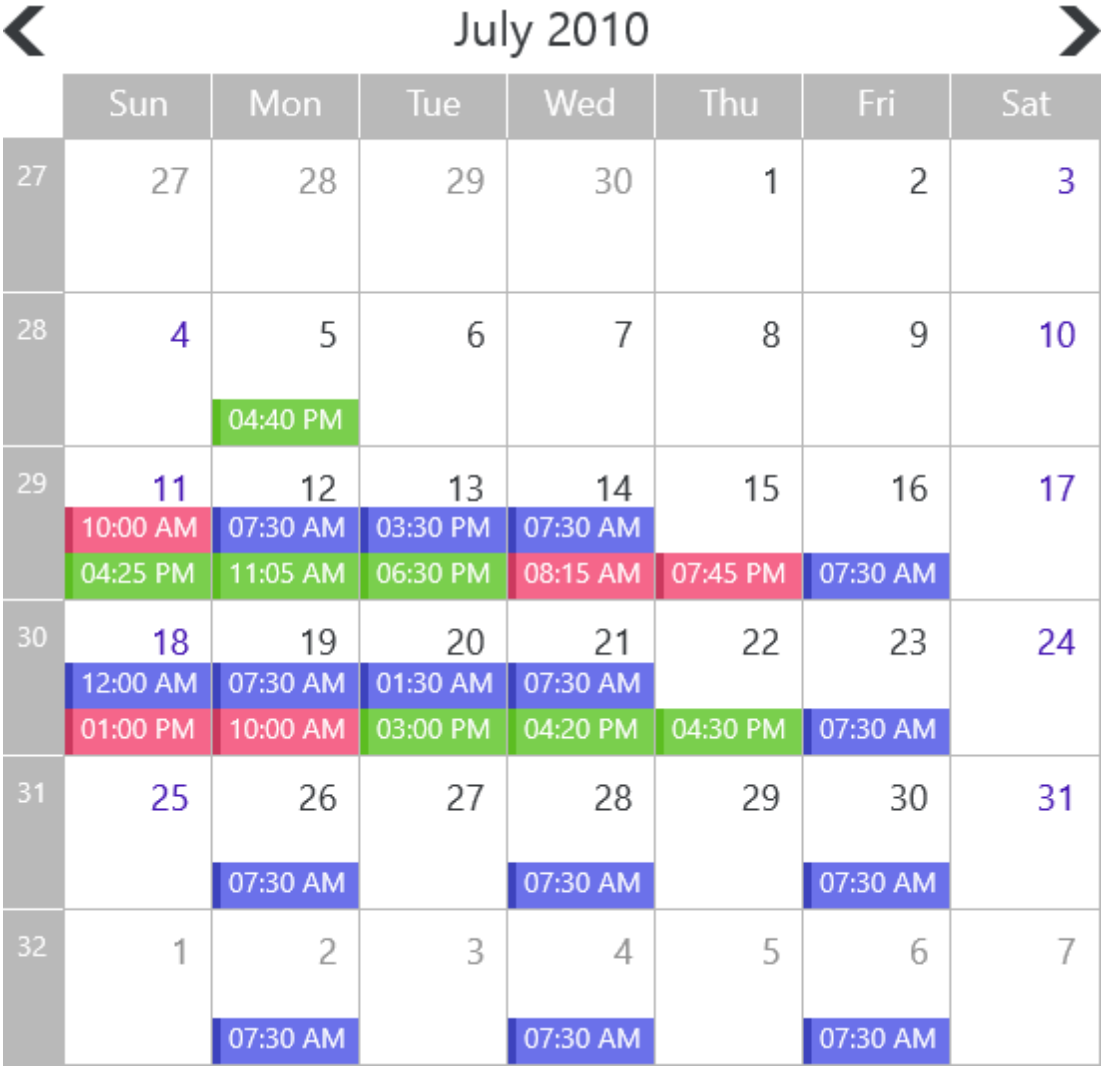
© 2018 Developer Express Inc.

DateNavigator

Windows 10 App Controls > Controls > Data Editors > Editor Types > DateNavigator

This editor type is implemented by the DateNavigator class. Its features include:

- Single and multiple selection modes
- Ability to customize cell appearance
- Multiple views (Month, Year, Decade, Century)
- Workdays, holidays and special dates support

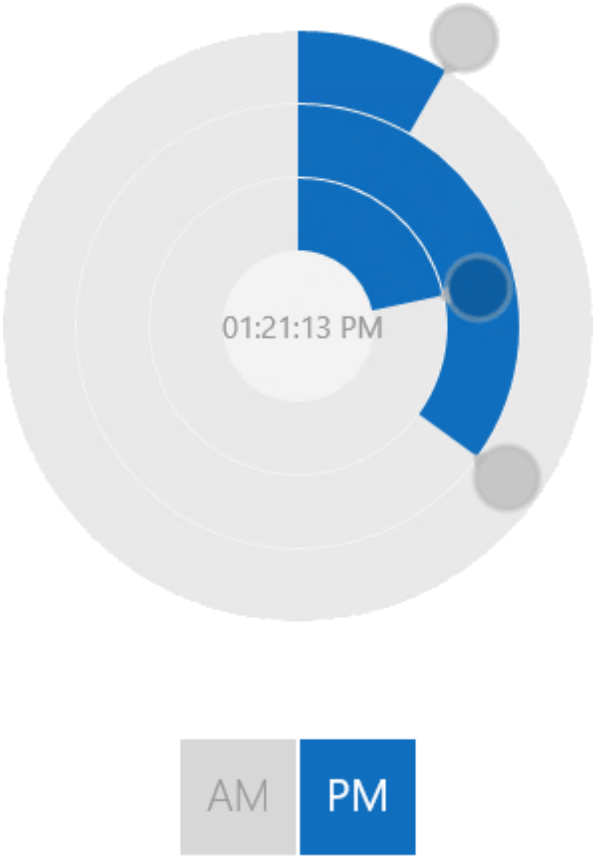


© 2018 Developer Express Inc.

Radial Time Picker

This editor type is implemented by the RadialTimePickerEdit class. Its features include:

- Touch-friendly interface that imitates the look and feel of an analog watch.
- The ability to limit time input to a predefined range.



© 2018 Developer Express Inc.

RangeControl

Windows 10 App Controls > Controls > Data Editors > Editor Types > RangeControl

This editor type is implemented by the RangeControl class. Its features include:

- Numeric and date-time value source support
- Various Range Control Clients that are used to visualize a range
- Zoom feature
- Touch support

RatingEdit

The RatingEdit control is used to visualize and edit ratings.

The **RatingEdit** control offers the following features.

- **Customizable precision**
  Use the RatingEdit.Precision property to specify the required precision. The following settings are available.
  - Exact
  - Full
  - Half
- **Customizable number of rating items**
  Use the RatingEdit.ItemsCount property to specify the number of rating items.
- **Customizable rating item appearance**
  You can change rating item appearance using custom styles. The following example demonstrates how to create **RatingEdit** with pentagonal rating items.

Xaml

```
<Editors:RatingEdit>
    <Editors:RatingEdit.ItemStyle>
        <Style TargetType="Editors:RatingItem">
            <Setter Property="Background" Value="LightGray" />
            <Setter Property="HoverBackground" Value="CadetBlue" />
            <Setter Property="SelectedBackground" Value="DarkCyan" />
            <Setter Property="VerticalAlignment" Value="Stretch" />
            <Setter Property="Geometry" Value="M27.5,0.5L54.5,21L44,54.5L11,54.5L0.5,21z" />
            </Setter>
        </Style>
    </Editors:RatingEdit.ItemStyle>
</Editors:RatingEdit>
```

To add the **RatingEdit** to a page, drag it from the Toolbox. Alternatively, you can create **RatingEdit** using XAML markup as shown in the code snippet below.

Xaml

```
xmlns:Editors="using:DevExpress.UI.Xaml.Editors"
<Editors:RatingEdit Precision="Half" ItemsCount="10" EditValue="7.5"/>
```

In this case, manually add references to the following libraries.

- DevExpress.Controls
- DevExpress.Core

To add references, right-click **References** in the Solution Explorer and select **Add Reference** in the invoked context menu.

Note

To collect all assemblies that may be required for your application, use the Assembly Deployment Tool.

© 2018 Developer Express Inc.

SpinEdit

Windows 10 App Controls > Controls > Data Editors > Editor Types > SpinEdit

This editor type is implemented by the SpinEdit class. Its features include:

- Customizable increment/decrement value.
- Properties specifying minimum and maximum allowed values.
- Capability to disable the text box and allow modification using only the spin buttons.
- Built-in numeric mask that only allows the entry of numeric values.

© 2018 Developer Express Inc.

TextEdit

This editor type is implemented by the TextEdit class. Its features include:

- Any number of buttons within the editor.
- Customizable button alignment.
- Total control over button content.
- Optional automatic default button.
- Full masked input support.
- Advanced data validation capabilities.
- Custom dropdown functionality.

© 2018 Developer Express Inc.

Input Validation Overview

Data Validation Basics

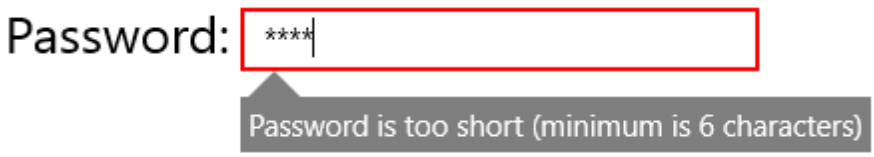
Data Validation takes place when a value specified by an end-user (e.g., when a user types within a text editor and presses the ENTER key) is assigned to the editor's BaseEdit.EditValue property. If the new value is invalid, it is not accepted by the editor. The editor temporarily stores the invalid value until it is corrected or reset.

There are two validation types: automatic validation and manual validation. Automatic validation controls user input using the mask functionality. Manual validation is implemented within the BaseEdit.Validate event handler. To learn more, see Input Validation Types.

Data Validation Features

The following data validation features are available in the DevExpress Editor Controls:

- Specify when data validation should take place (when the ENTER key is pressed after text is modified, or when an attempt is made to move focus away from the editor after text is modified). For more information, see BaseEdit.ValidateOnTextInput and BaseEdit.ValidateOnEnterKeyPressed.
- Reset invalid values by pressing the ESC key or by using the BaseEdit.ClearError method.
- Automatically display an animated error icon with a corresponding tooltip that shows the error message.



Concepts

- Input Validation Types

© 2018 Developer Express Inc.

Input Validation Types

When creating applications that allow users to input values, it is important to check the validity of the values that are entered. The DevExpress Universal Editor Controls provide both automatic and manual input validation facilities.

Automatic Validation Using Masks

User input is automatically controlled by the editor when using the mask functionality. Masks let you specify the pattern used to input values, and an end-user cannot enter text that is not permitted by the mask. Thus, in masked mode the values entered always match the edit masks.

Manual Validation

In some cases, however, you may want to provide manual validation (limit the range of valid values, implement a conditional validation mechanism, etc.). Handle the BaseEdit.Validate event to do this. This event lets you check the value entered into an editor before it is accepted. If the value entered does not meet your requirements, or is of the wrong type, you can indicate that the current value has failed validation.

The BaseEdit.Validate event is raised for an editor if the editor's BaseEdit.CausesValidation property is set to true. Editor validation can fire in the following cases:

- The editor is about to lose focus.
- An end-user types a symbol in the editor's edit box. (The BaseEdit.ValidateOnTextInput property must be set to **true**.)
- An end-user presses the ENTER key. (The BaseEdit.ValidateOnEnterKeyPressed property must be set to **true**.)

You can also use the BaseEdit.DoValidate method to perform validation at any time.

To indicate that the edit value has failed validation, set the **IsValid** property of the BaseEdit.Validate event's argument to **false**.

Masked Input

Topics in this section:

- Masked Input Overview
- Mask Types

© 2018 Developer Express Inc.

Masked Input Overview

DevExpress Universal Editors allow you to use masks during editing. Masks provide restricted data input as well as formatted data output.

Using masks in editors is useful when an entered string needs to match a specific format. For instance, a text editor should accept date/time values in a 24-hour format or numeric values. Another example is entering a phone number within an editor (an end-user needs to enter only digits, while hyphens should automatically be skipped while editing). To support these and many other data input formats, a masked mode can be used.

The following mask types are supported.

- **Numeric**

This mask type is the best choice when you need to restrict input to numeric values. The mask is specified using simple .NET Framework format strings. If you need to restrict input to currency values, you can simply specify the one-character "c" mask. No literal characters will be allowed, and the mask will not allow more than two digits after the decimal point. End-users will be able to navigate through digits and increase or decrease their values using the UP and DOWN arrows or the mouse wheel.

- **Date-Time**

This mask type has a lot in common with the Numeric mask and is used for date-time values. You can also specify the mask using .NET Framework format strings because the same end-user capabilities are available. These include navigation between value sections (days, months, years, hours, etc.) and incremental value modifications using the keyboard and the mouse wheel.

- **Simple Masks**

This mask type is the best when you need to enter strings of limited length, such as phone numbers, zip codes, social security numbers, etc. The mask is specified using a sequence of characters. Some characters serve as placeholders for digits or letters, while others are literals used to separate value sections. An example of such literals is parentheses for the area code in a phone number.

- **Regular Expression Masks**

If the mask types listed above do not meet your business requirements, you can use regular expressions that have no limitations. Any regular expression can be used as a mask.

An editor's mask settings can be defined using the TextEdit.TextInputSettings property. Masks are usually used in edit mode. When an editor is not in edit mode, its display text can be also formatted using the specified mask if the **UseAsDisplayFormat** property is set to **true**. If this property is **false**, an editor's display text is composed using the BaseEdit.DisplayFormatString format in display mode.

            <Editors:DateEdit.TextInputSettings>
                <Editors:TextInputMaskSettings UseAsDisplayFormat="{Binding ElementName=checkBox, Path=Is
            </Editors:DateEdit.TextInputSettings>
        </Editors:DateEdit>
        <CheckBox Name="checkBox" HorizontalAlignment="Center" VerticalAlignment="Bottom" Content="UseAsD
    </Grid>
</Page>
```

© 2018 Developer Express Inc.

Mask Types

To enable masked input, set the TextEdit.TextInputSettings property to DevExpress.UI.Xaml.Editors.TextInputMaskSettings. A mask string identifies a data input pattern. You can use either predefined mask strings or compose your own mask expressions. Mask strings should be set according to the mask type. The available mask types are listed in the following table:

Mask Type	Use this mask if...	Description	Samples
None		Masked mode is disabled.	
DateTime **DateTimeAdvancingCaret**	...an editor requires that date/time values be in a specific format.	Masks of the **DateTime/DateTimeAdvancingCaret** type significantly simplify the input of date/time values. Predefined masks can be used to enter values using common date/time patterns. It's also possible to create custom masks that specify which parts (year, month, day, hour, minute, etc.) of a date/time value can be edited. The syntax used for these masks is similar to the date/time formats described in the Standard Date and Time Format Strings topic in MSDN.	EditMask: **D** (long date pattern); Friday, December 21, 2012 EditMask: **yyyy-MMM-d, HH:mm:ss** (custom date pattern); 2012-Dec-31, 23:59:59
Numeric	...an editor requires that numeric values be in a specific format.	Masks of the **Numeric** type significantly simplify the input of numeric values (currency, integer, float, etc.). Masks in this mode allow numeric values to be entered using various common and custom patterns. It is possible to specify the number of optional and required digits to the left and to the right of the decimal separator, whether to display thousand separators, etc. The syntax used for these masks is similar to the numeric formats described in the Standard Numeric	EditMask: **c** (currency); $15.00 EditMask: **# ##0.00 $** (custom); 4 234.06 $

© 2018 Developer Express Inc.

		Format Strings topic in MSDN. Specific masks are dependent upon the current culture's settings.	
Simple	...the string an end-user can enter is of a fixed format (without alternatives) and a fixed length (for instance, phone numbers and alpha-numeric sequences).	This mask type also supports optional characters (for instance, when it is possible to specify that the code of a phone number should contain 0 to 3 digits). Any auxiliary characters can be included in these masks. These auxiliary characters will be displayed in the edit box as is, and will be skipped while editing (for instance, hyphens in phone numbers).	EditMask: **(999)000-00-00** (phone number) Regular		In this mode, masks use the simplified regular expression syntax. This mode is designed for backwards compatibility. Instead, use the **RegEx** mode, which implements full functional regular expressions that give you more flexibility to control data input.	
RegEx	... the length of the string an end-user can enter is not fixed; or ... the value can be entered using one of several alternative forms; or ... only characters from a specific range can be entered at a specific position; or ... the auto-complete feature is available (an end-user enters text and the editor completes this variant if there are no other alternatives)	In this mode you can construct masks using full functional regular expressions. This gives you great flexibility to control data input. For instance, it's possible to create a single mask that will allow end-users to enter a time value using either the 12-hour or 24-hour format.	EditMask: **((\+\d)?\(\d{3}\))?\d{3}-\d\d-\d\d** (several valid forms to enter a phone number)

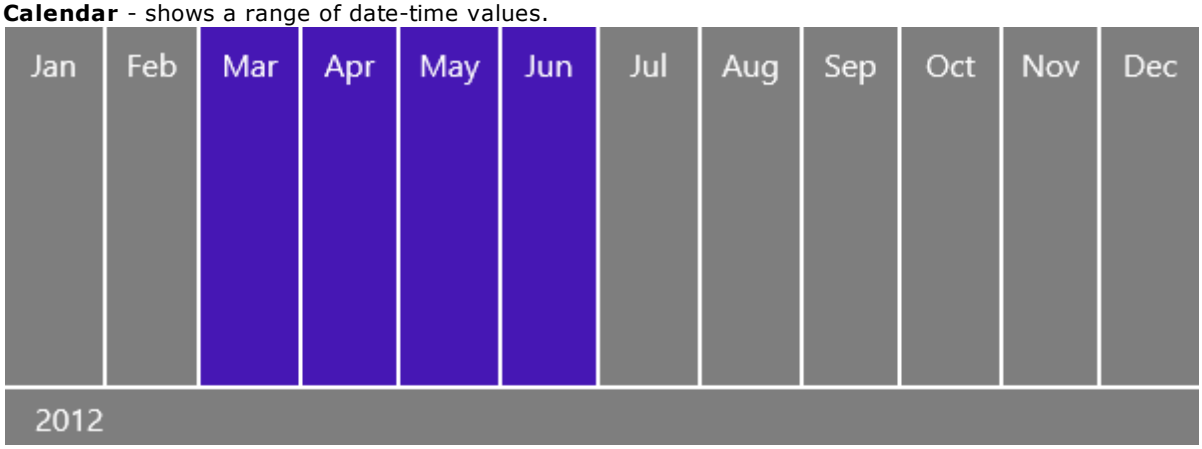
Range Control Clients

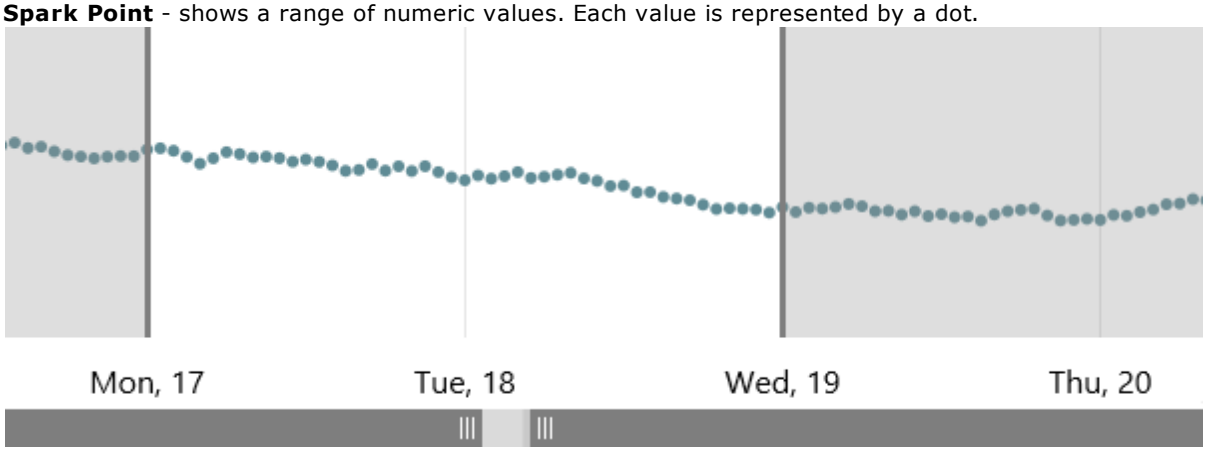
The Range Control Clients are special objects used to visualize a range. Clients interact with the Range Control via the IRangeControlClient interface.

Below is a list of DevExpress Range Control Clients.

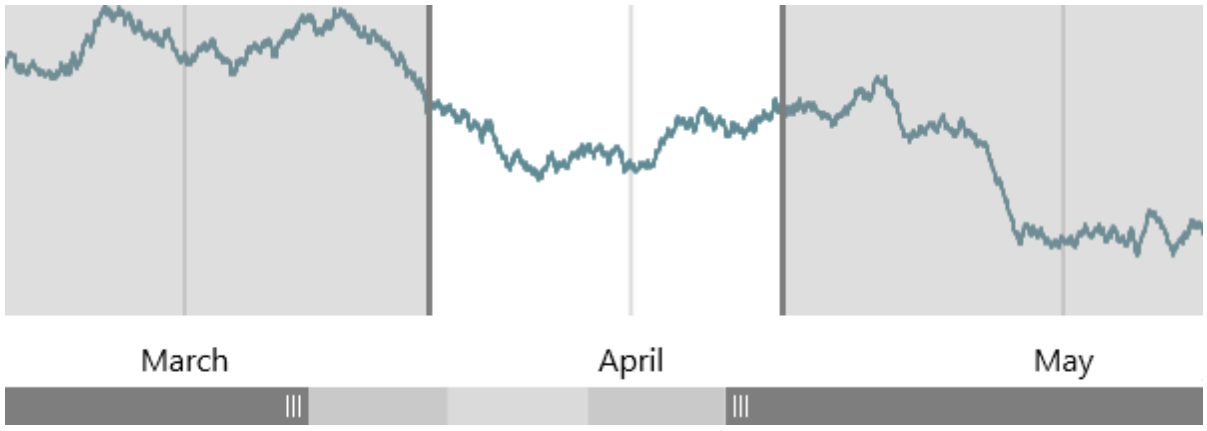
- **Calendar** - shows a range of date-time values.



- **Spark Point** - shows a range of numeric values. Each value is represented by a dot.

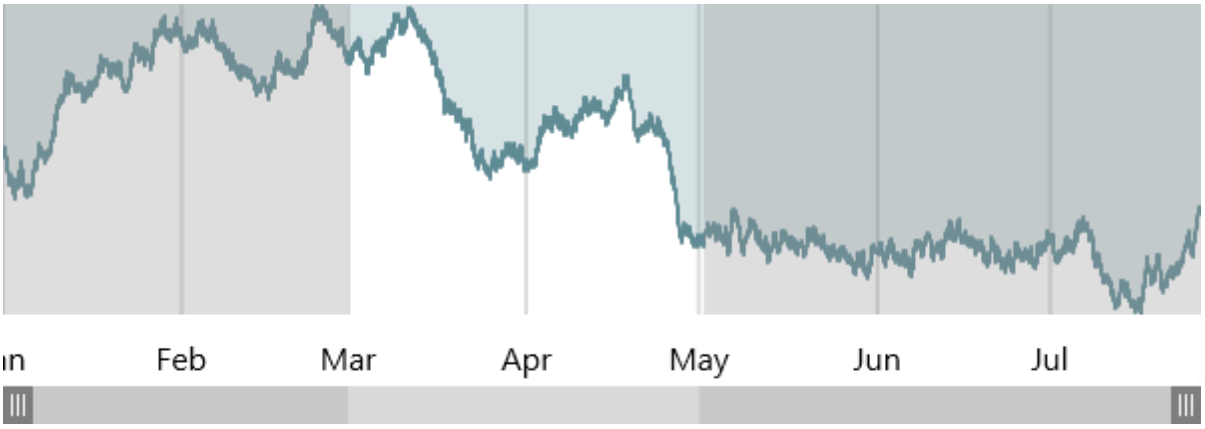


- **Spark Line** - shows a range of numeric values. Each value is represented by a dot. Dots are connected by a continuous line.

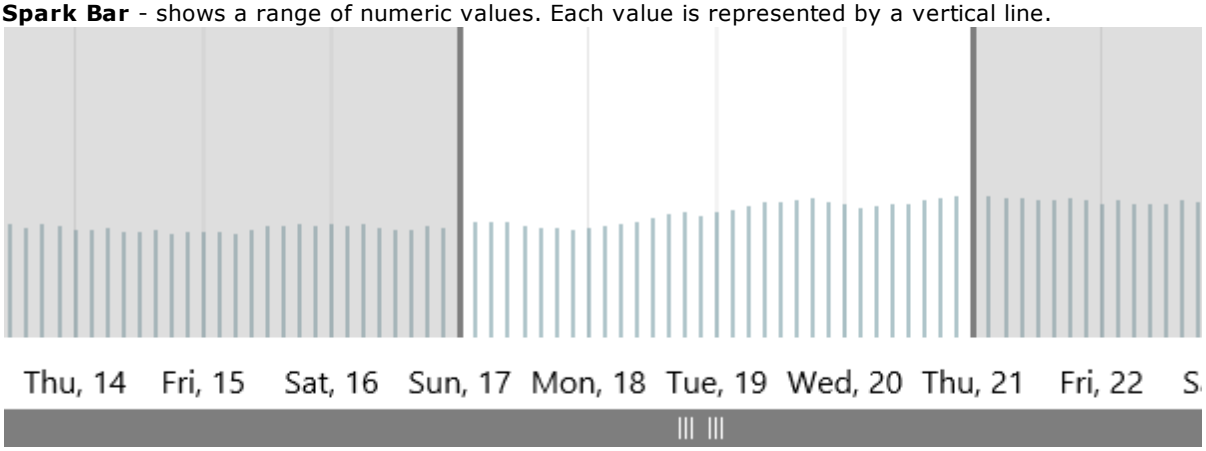


- **Spark Area** - shows a range of numeric values. Each value is represented by a dot. Dots are connected by a continuous line. The areas above and below the line are of different colors.

© 2018 Developer Express Inc.



- **Spark Bar** - shows a range of numeric values. Each value is represented by a vertical line.



Show Me

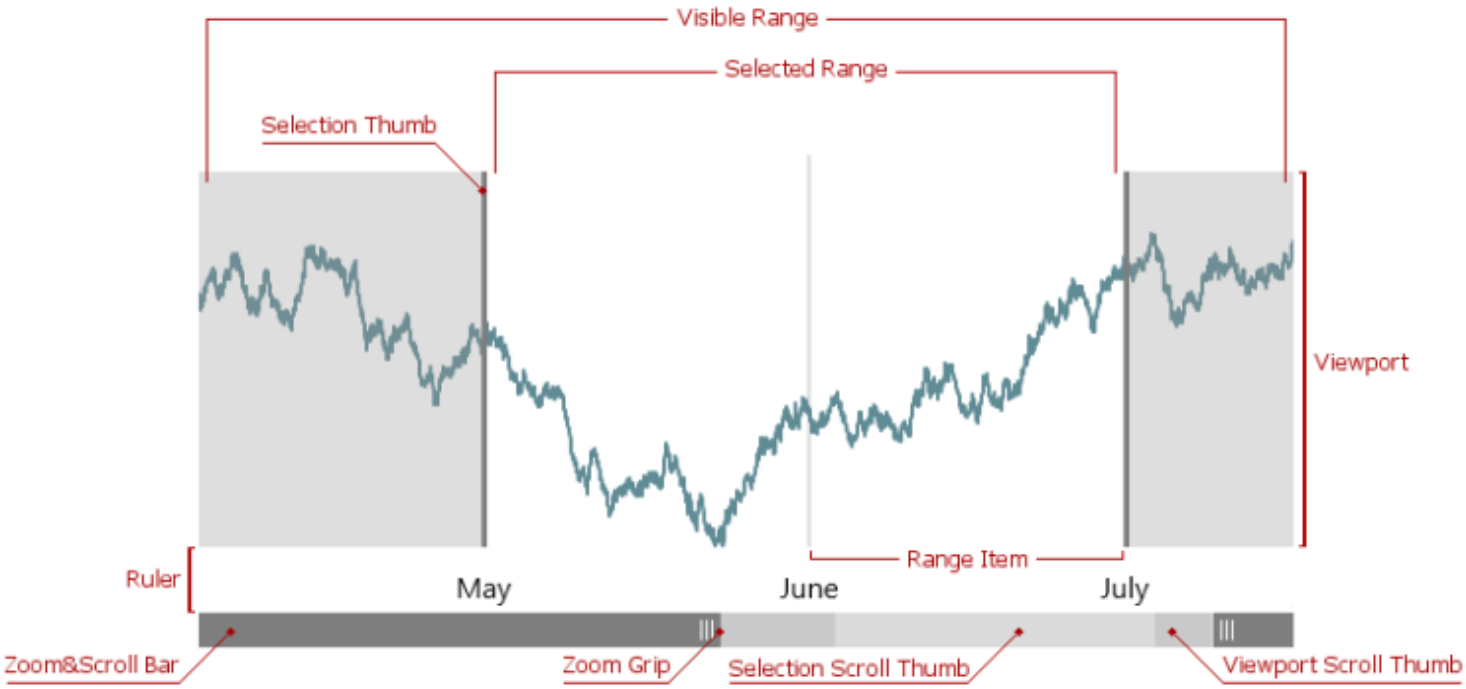
Range Control Visual Elements

The following image shows the Range Control's visual elements:



Element	Description
Viewport	The area where the Range Control's Client draws the data that falls into the currently visible range.
Ruler	Displays values along the visible range.
Zoom&Scroll Bar	Contains controls that allow you to scroll and zoom the visible range.
Selection Thumb	Two selection thumbs mark the selected range. You can drag them to change the selection.
Viewport Scroll Thumb	Marks the visible range within the total range. It can be scrolled by dragging, and can be resized via the Zoom Grips to change the visible range.
Zoom Grip	Zoom Grips are parts of the Viewport Scroll Thumb. They allow you to change the visible range by zooming in and out.
Selection Scroll Thumb	Marks the selected range within the total range. It can be scrolled to move the selected range.
Range Item	A unit interval. It is automatically adjusted based on the current zoom level.

© 2018 Developer Express Inc.

Range Control Touch Capabilities

- Tap an item to select it.
- Slide the Selection Thumbs to change the selected area. If the Selection Thumbs are not visible, slide the edges of the selected area.
- Double tap an item to select it and stretch it to fill the visible range.
- Drag the Zoom Grips to change the visible range.
- Drag the Zoom&Scroll Bar to scroll.
- Press and hold an unselected item to select it. Drag while holding to change the selected area.
- Press, hold and drag the Selected Range to pan it.
- Slide or flick to scroll.
- Pinch to zoom.

Data Grid

Windows 10 App Controls > Controls > Data Grid

Create compelling Windows 10 business solutions that deliver on the touch-first promise with all the power to shape and manipulate data as end-user needs dictate. The high-performance DevExpress Data Grid and Data Editors exploit the power inherent in Windows 10 without limiting traditional features you've come to expect from a powerful Grid and Data Editors Library.

Getting Started

If you are a first-time user, you can refer to the following tutorials to get acquainted with the **DevExpress GridControl**. These examples demonstrate the control's basic functionality and provide you with step-by-step instructions on how to create simple applications with **DevExpress GridControl**.

Topics in this section:

- Lesson 1 - Binding to Data

In this tutorial, you'll learn how to use the DevExpress GridControl to display data in a Windows Metro Style Application.

- Lesson 2 - Displaying Summary Information

In this tutorial, you'll learn how to quickly analyze your data by displaying aggregate function values calculated against the entire dataset.

- Lesson 3 - Displaying Detail Page

In this tutorial, you'll learn how to show a detail page by clicking a data row.

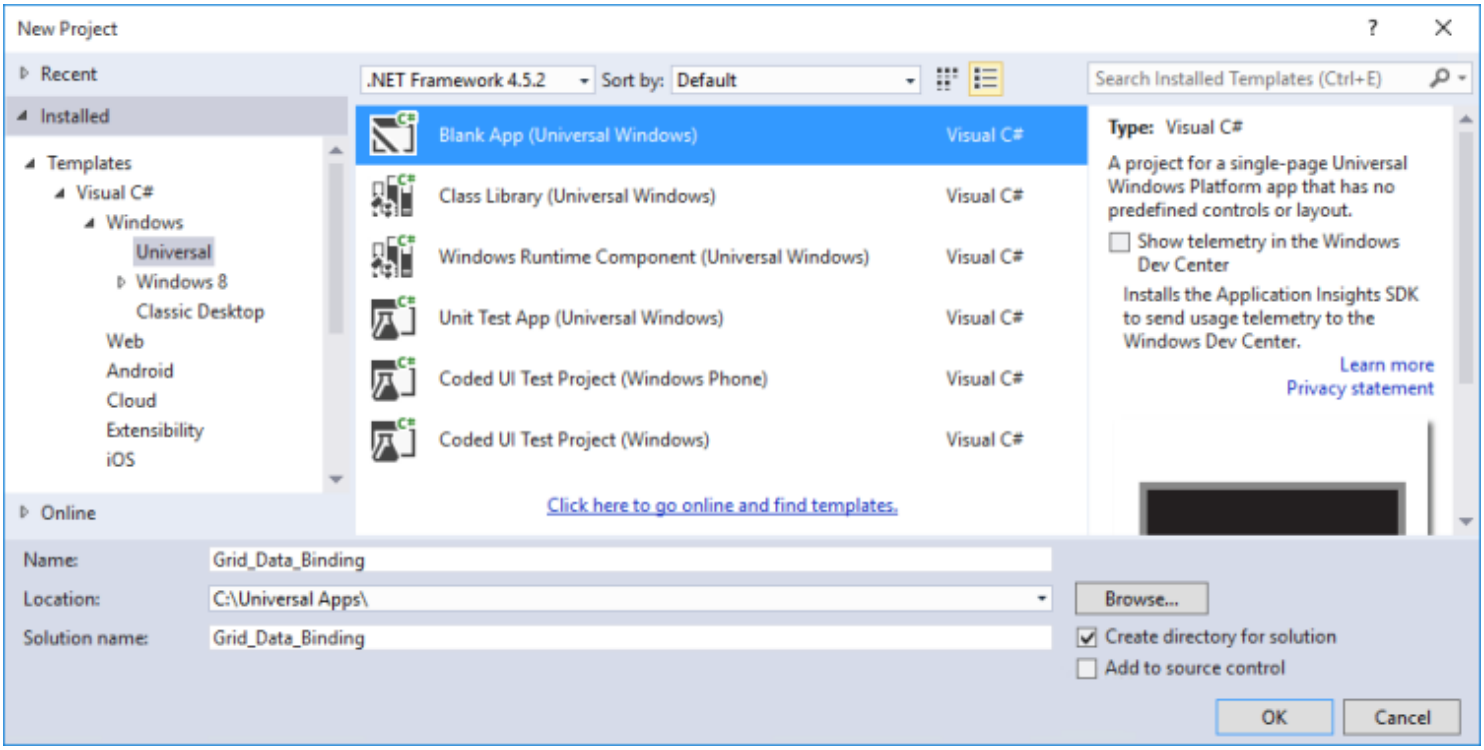
© 2018 Developer Express Inc.

Lesson 1 - Binding to Data

This document demonstrates how to create a GridControl and bind it to data.

Do the following:

1. Run MS Visual Studio 2015 or 2017.
2. Create a new Windows Universal project. To do this, choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose the **Windows Universal** template category, and then choose **Blank App (XAML)**.



3. Define data context:

C#

```
using System.Collections.ObjectModel;
using Windows.UI.Xaml.Controls;
namespace Grid_Data_Binding {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ProductList();
        }
        public class Product {
            public string ProductName { get; set; }
            public string Country { get; set; }
            public string City { get; set; }
            public double UnitPrice { get; set; }
            public int Quantity { get; set; }
        }
        public class ProductList : ObservableCollection<Product> {
            public ProductList()
                : base() {
                Add(new Product() { ProductName = "Chang", Country = "UK", City = "Cowes", UnitPrice = 19,
                Add(new Product() { ProductName = "Gravad lax", Country = "Italy", City = "Reggio Emilia",
                Add(new Product() { ProductName = "Ravioli Angelo", Country = "Brazil", City = "Rio de Jar
                Add(new Product() { ProductName = "Tarte au sucre", Country = "Germany", City = "QUICK-Sto
                Add(new Product() { ProductName = "Steeleye Stout", Country = "USA", City = "Reggio Emilia
                Add(new Product() { ProductName = "Pavlova", Country = "Austria", City = "Graz", UnitPrice
                Add(new Product() { ProductName = "Longlife Tofu", Country = "USA", City = "Boise", UnitPr
                Add(new Product() { ProductName = "Alice Mutton", Country = "Mexico", City = "México D.F.'
                Add(new Product() { ProductName = "Alice Mutton", Country = "Canada", City = "Tsawwassen",
            }
        }
    }
}
```

4. Switch to the **MainPage.xaml** file. Open the Visual Studio toolbox, locate the "DX.18.1: Data" tab, choose the **GridControl** toolbox item and drop it onto the window.

Note

Dropping the **GridControl** toolbox item onto the window will automatically add all the required references (DevExpress.Core and DevExpress.Data). To add the **GridControl** in code, reference these extensions manually.

5. Right-click the **GridControl** and select **Reset Layout** - **All**.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:Grid_Data_Binding"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Grid="using:DevExpress.UI.Xaml.Grid"
    x:Class="Grid_Data_Binding.MainPage"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Grid:GridControl AutoGenerateColumns="True"/>
    </Grid>
</Page>
```

6. To bind the **GridControl** to data, use its DataControlBase.ItemsSource property. By default, the grid automatically creates columns for all fields in a data source.

Xaml

© 2018 Developer Express Inc.

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:Grid_Data_Binding"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Grid="using:DevExpress.UI.Xaml.Grid"
    x:Class="Grid_Data_Binding.MainPage"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Grid:GridControl AutoGenerateColumns="True" ItemsSource="{Binding}"/>
    </Grid>
</Page>
```

7. Run the application to see the result.

8. To manually create columns, set the DataControlBase.AutoGenerateColumns property to **false** and add GridColumnBase objects to the GridControl.Columns collection.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:Grid_Data_Binding"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Grid="using:DevExpress.UI.Xaml.Grid"
    x:Class="Grid_Data_Binding.MainPage"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Grid:GridControl AutoGenerateColumns="False" ItemsSource="{Binding}">
            <Grid:GridControl.Columns>
                <Grid:GridTextColumn FieldName="ProductName" />
                <Grid:GridTextColumn FieldName="UnitPrice" />
                <Grid:GridTextColumn FieldName="Quantity" />
            </Grid:GridControl.Columns>
        </Grid:GridControl>
    </Grid>
</Page>
```

© 2018 Developer Express Inc.

9. Run the application to see the result.

Lesson 2 - Displaying Summary Information

© 2018 Developer Express Inc.

Lesson 2 - Displaying Summary Information

This lesson shows how to display summary information (Count, Max, Min, Sum, etc.) against individual columns - **total summary**.

- **Create Total Summaries**

A total summary is an aggregate function value calculated over all data rows within a grid and displayed within the **Fixed Summary Panel**. Summaries within the Fixed Summary Panel are always displayed onscreen and not horizontally scrolled.

Total summaries are represented by SummaryItemBase objects and stored within the GridControl.TotalSummary collection.

Create two summary items. One item to display the total number of rows within the grid, another item to display the maximum product price.

Xaml

```
<Grid:GridControl.TotalSummary>
    <Grid:GridSummaryItem FieldName="ProductName" SummaryType="Count" Alignment="Left"/>
    <Grid:GridSummaryItem FieldName="UnitPrice" SummaryType="Max" Alignment="Right"/>
</Grid:GridControl.TotalSummary>
```

Note

Total summaries can be displayed either to the summary panel's left or right. The horizontal alignment is specified by the SummaryItemBase.Alignment property.

- **Display Summary Information**

Set the grid's DataControlBase.ShowFixedTotalSummary property to **true** to display the fixed summary panel.

- **Result**

Run the application. The image below shows the result.

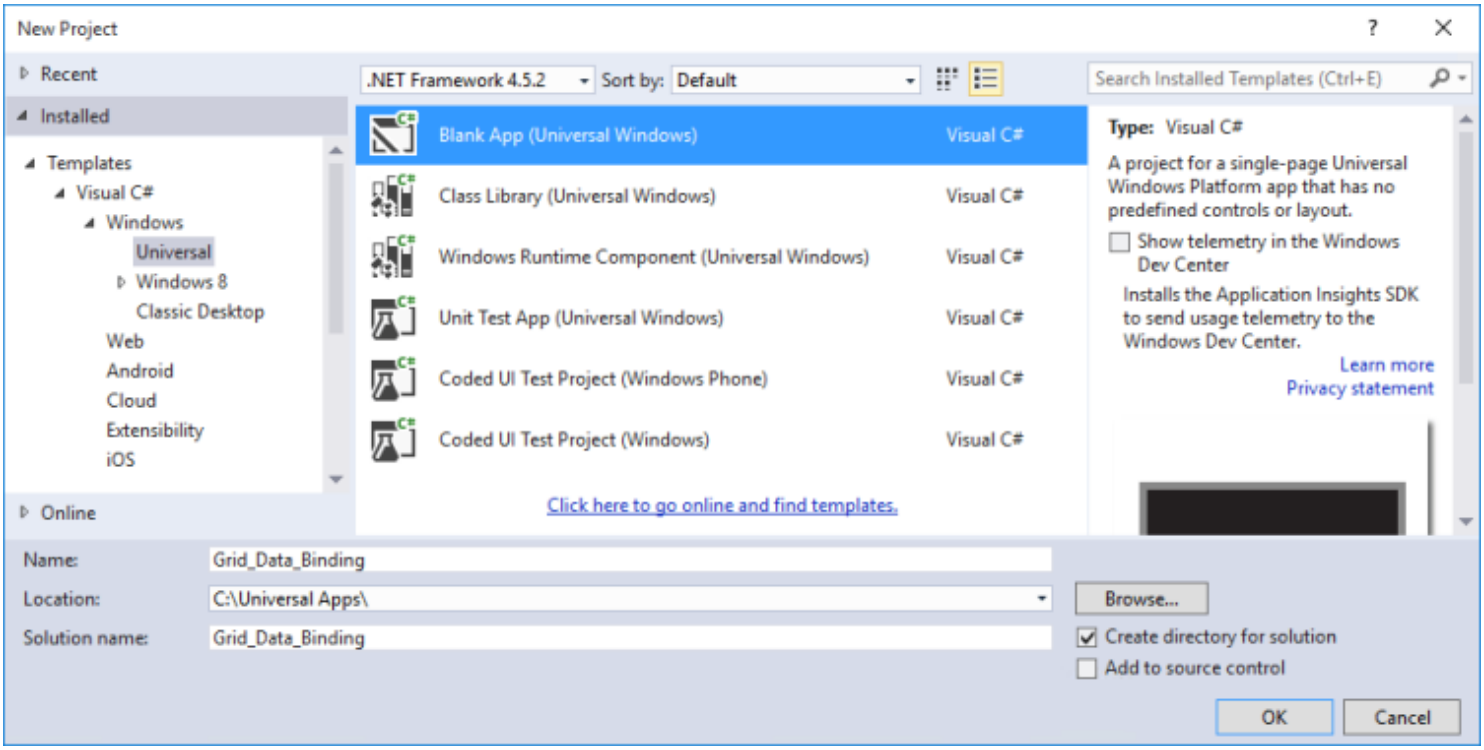
Lesson 3 - Displaying Detail Page

This lesson demonstrates how to:

- Create a separate page that displays all fields of a data object;
- Display this page when clicking a data row.

Do the following.

1. Run MS Visual Studio 2015 or 2017.
2. Create a new Universal Windows Platform application. To do this, choose **New Project** on the **File** menu or press **Ctrl+Shift+N**, choose **Universal**, and then choose **Blank App (Universal Windows)**.



3. Open the Visual Studio toolbox, locate the "DX.18.1: Data" tab, choose the **GridControl** toolbox item and drop it onto the window.

Note

Dropping the **GridControl** toolbox item onto the window will automatically add all the required references (DevExpress.Core and DevExpress.Data). To add the **GridControl** in code, reference these extensions manually.

4. Right-click the **GridControl** and select **Layout** - **Reset All**.
5. Open the MainPage.xaml.cs file, and add specify **DataContext**.

C#

© 2018 Developer Express Inc.

```
using System.Collections.Generic;
using Windows.UI.Xaml.Controls;
namespace DetailPage {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = ProductData.Source;
        }
        public static class ProductData {
            static List<Products> products;
            public static List<Products> Source {
                get {
                    if (products == null) {
                        products = new List<Products>();
                        products.Add(new Products() { ProductName = "Chang", Country = "UK", City = "Cowes
                        products.Add(new Products() { ProductName = "Gravad lax", Country = "Italy", City
                        products.Add(new Products() { ProductName = "Ravioli Angelo", Country = "Brazil",
                        products.Add(new Products() { ProductName = "Tarte au sucre", Country = "Germany",
                        products.Add(new Products() { ProductName = "Steeleye Stout", Country = "USA", Cit
                        products.Add(new Products() { ProductName = "Pavlova", Country = "Austria", City =
                        products.Add(new Products() { ProductName = "Longlife Tofu", Country = "USA", City
                        products.Add(new Products() { ProductName = "Alice Mutton", Country = "Mexico", Ci
                        products.Add(new Products() { ProductName = "Alice Mutton", Country = "Canada", Ci
                    }
                    return products;
                }
            }
        }
        public class Products {
            public string ProductName { get; set; }
            public string Country { get; set; }
            public string City { get; set; }
            public double UnitPrice { get; set; }
            public int Quantity { get; set; }
        }
    }
}
```

6. Bind the **GridControl** to data.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:DetailPage"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Grid="using:DevExpress.UI.Xaml.Grid"
    x:Class="DetailPage.MainPage"
    mc:Ignorable="d">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Grid:GridControl ItemsSource="{Binding}"/>
    </Grid>
</Page>
```

7. By default, the grid automatically creates columns for all fields in a data source. Set the DataControlBase.AutoGenerateColumns property to **false** and create two columns.

Xaml

```
<Grid:GridControl ItemsSource="{Binding}" AutoGenerateColumns="False">
    <Grid:GridControl.Columns>
            <Grid:GridTextColumn FieldName="ProductName"/>
            <Grid:GridTextColumn FieldName="Quantity"/>
    </Grid:GridControl.Columns>
</Grid:GridControl>
```

© 2018 Developer Express Inc.

8. Right-click the application at the Solution Explorer and select **Add|NewItem** or press CTRL+SHIFT+A. Select the **Blank Page** template and click **Add**. Note that the type of the created page is **Page**. To be able to override the **LoadState** method, change the page's type from **Page** to **DXPage** in both *.xaml and *.xaml.cs.
9. In XAML, create the layout of the new page. In this lesson, this page displays five data fields and the **Back** button.

Xaml

```
<layout:DXPage
    x:Class="DetailPage.Details"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:DetailPage"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:layout="using:DevExpress.UI.Xaml.Layout"
    mc:Ignorable="d">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Grid.ColumnDefinitions>
            <ColumnDefinition Width="Auto"/>
            <ColumnDefinition/>
        </Grid.ColumnDefinitions>
        <Button Content="Back" VerticalAlignment="Top" Click="Button_Click_1"/>
        <Grid Grid.Column="1">
            <Grid.ColumnDefinitions>
                <ColumnDefinition Width="Auto"/>
                <ColumnDefinition/>
            </Grid.ColumnDefinitions>
            <Grid.RowDefinitions>
                <RowDefinition Height="Auto"/>
                <RowDefinition Height="Auto"/>
                <RowDefinition Height="Auto"/>
                <RowDefinition Height="Auto"/>
                <RowDefinition Height="Auto"/>
            </Grid.RowDefinitions>
            <TextBlock Text="Product Name: " VerticalAlignment="Center"/>
            <TextBox Text="{Binding Path=ProductName, Mode=TwoWay}" Grid.Column="1" Margin="5"/>
            <TextBlock Text="Country: " Grid.Row="1" VerticalAlignment="Center"/>
            <TextBox Text="{Binding Path=Country, Mode=TwoWay}" Grid.Column="1" Grid.Row="1" Margin="5"/>
            <TextBlock Text="City: " Grid.Row="2" VerticalAlignment="Center"/>
            <TextBox Text="{Binding Path=City, Mode=TwoWay}" Grid.Column="1" Grid.Row="2" Margin="5"/>
            <TextBlock Text="Unit Price: " Grid.Row="3" VerticalAlignment="Center"/>
            <TextBox Text="{Binding Path=UnitPrice, Mode=TwoWay}" Grid.Column="1" Grid.Row="3" Margin="5",
            <TextBlock Text="Quantity: " Grid.Row="4" VerticalAlignment="Center"/>
            <TextBox Text="{Binding Path=Quantity, Mode=TwoWay}" Grid.Column="1" Grid.Row="4" Margin="5"/
        </Grid>
    </Grid>
</layout:DXPage>
```

C#

```
using DevExpress.UI.Xaml.Layout;
using Windows.UI.Xaml;
namespace DetailPage {
    public sealed partial class Details : DXPage {
        public Details() {
            this.InitializeComponent();
        }
        void Button_Click_1(object sender, RoutedEventArgs e) {
            GoBack();
        }
        protected override void LoadState(object navigationParameter, DevExpress.Core.PageStateStorage pa
        }
    }
}
```

10. Implement the LoadState method to provide the text fields defined in XAML with data.

C#

© 2018 Developer Express Inc.

```
using DevExpress.Core.Navigation;
using DevExpress.UI.Xaml.Layout;
using Windows.UI.Xaml;
using System.Linq;
namespace DetailPage {
    public sealed partial class Details : DXPage {
        public Details() {
            this.InitializeComponent();
        }
        void Button_Click_1(object sender, RoutedEventArgs e) {
            GoBack();
        }
        protected override void LoadState(object navigationParameter, DevExpress.Core.Navigation.PageState
            base.LoadState(navigationParameter, pageState);
            DataContext = DetailPage.MainPage.ProductData.Source.Where(data => data.ProductName == (string
        }
    }
}
```

11. Open the *App.xaml.cs* file. By default, the **OnLaunched** method uses the instance of the Windows.UI.Xaml.Controls.Frame class as a root frame. Change this method to use the DevExpress.UI.Xaml.Layout.DXFrame instance provided with a NavigationTypeProvider. The *App.xaml.cs* file should look like the following.

C#

```
using System;
using System.Collections.Generic;
using DevExpress.UI.Xaml.Layout;
using Windows.ApplicationModel;
using Windows.ApplicationModel.Activation;
using Windows.UI.Xaml;
using Windows.UI.Xaml.Controls;
using System.Reflection;
namespace DetailPage {
    sealed partial class App : Application {
        public App() {
            this.InitializeComponent();
            this.Suspending += OnSuspending;
        }
        protected override void OnLaunched(LaunchActivatedEventArgs args) {
            Frame rootFrame = Window.Current.Content as Frame;
            if (rootFrame == null) {
                rootFrame = new DXFrame() { NavigationTypeProvider = new NavigationTypeProvider() };
                if (args.PreviousExecutionState == ApplicationExecutionState.Terminated) {
                }
                Window.Current.Content = rootFrame;
            }
            if (rootFrame.Content == null) {
                if (!rootFrame.Navigate(typeof(MainPage), args.Arguments)) {
                    throw new Exception("Failed to create initial page");
                }
            }
            Window.Current.Activate();
        }
        private void OnSuspending(object sender, SuspendingEventArgs e) {
            var deferral = e.SuspendingOperation.GetDeferral();
            deferral.Complete();
        }
    }
    public class NavigationTypeProvider : TypeProviderBase {
        public override IEnumerable<System.Reflection.Assembly> Assemblies {
            get {
                yield return typeof(App).GetTypeInfo().Assembly;
            }
        }
    }
}
```

12. Set the **ItemNavigationTargetType** property to **Details** to display the designed DXPage when clicking an item. Set the **ItemNavigationTargetParameterBinding** to "{Binding Path=ProductName}" to pass the required data.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:DetailPage"

Binding to ICollectionView

The **Grid Control** supports ICollectionView binding. If the DataControlBase.IsSynchronizedWithCurrentItem property is set to **true**, the grid automatically synchronizes its currently selected item with the underlying collection.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4348.	

The example shows how to bind the Grid Control to the ICollectionView.

Use buttons to select an item in the collection. A checkbox specifies whether the grid's currently selected item is synchronized with the collection.

Unbound Columns

Bound and Unbound Columns

The Grid Control supports bound and unbound columns. Bound columns obtain their data from data fields in a grid's data source. Unbound columns are not bound to any field in the data source. There is no difference between working with bound and unbound columns. You can sort, group, display summaries and filter unbound columns in the same manner as bound columns.

An unbound column, however, is one that meets the following two requirements:

- The ColumnBase.FieldName property must be set to a unique value, and not refer to any field in the grid's data source.
- The ColumnBase.UnboundType property must be set to an appropriate value according to the type of data this column should display (Boolean, Bound, DateTime, Decimal, Integer, String or Object).

Note

If unbound data is obtained from a custom data source, when adding a new row you should add a new entry to the custom data source that corresponds to the new record in the grid. Similarly, when a record is deleted, delete the corresponding entry in the custom data source. To receive notifications that a record has been added or removed, use the methods provided by the data source.

Note

The Grid Control cannot operate with only unbound columns. It must be bound to a data source using its DataControlBase.ItemsSource property.

Provide Data for Unbound Columns

Unbound columns must be populated manually. You can use the ColumnBase.UnboundExpression property and specify an expression used to evaluate values for an unbound column based on the items source records.

The sample code below shows how to specify an unbound expression to display the total price, calculated as: UnitPrice * Quantity:

C#

```
<grid:GridColumn FieldName="Total" UnboundType="Decimal" UnboundExpression="[UnitPrice] * [Quantity]"/>
```

If data for unbound columns is obtained from a custom data source, handle the GridControl.CustomUnboundColumnData event.

Example: Display Unbound Data

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4306.

This example shows how to add an unbound column to the Grid Control.

C#

Updating Unbound Data

In most instances, the grid updates unbound cells automatically. To force unbound data updates manually, use the DataControlBase.UpdateUnboundColumnValues method. This method updates all unbound cells contained within the specified data row regardless of how unbound data s supplied (via event handler or unbound expression).

© 2018 Developer Express Inc.

Data Management

The topics in this section describe the Grid's data analysis features. Many of these data managing and shaping capabilities are enabled with simple property settings.

- Data Summaries

You can calculate aggregate functions against all values within a column, or column values within groups. The Grid Control offers 5 built-in aggregate functions. Custom aggregate functions can be implemented via event handlers.

- Grouping

The Grid Control supports data grouping against an unlimited number of data columns.

- Filtering and Searching

The functionality to filter data and locate rows programmatically or via UI.

- Sorting

Programmatic or end-user sorting against an unlimited number of data columns in ascending or descending order.

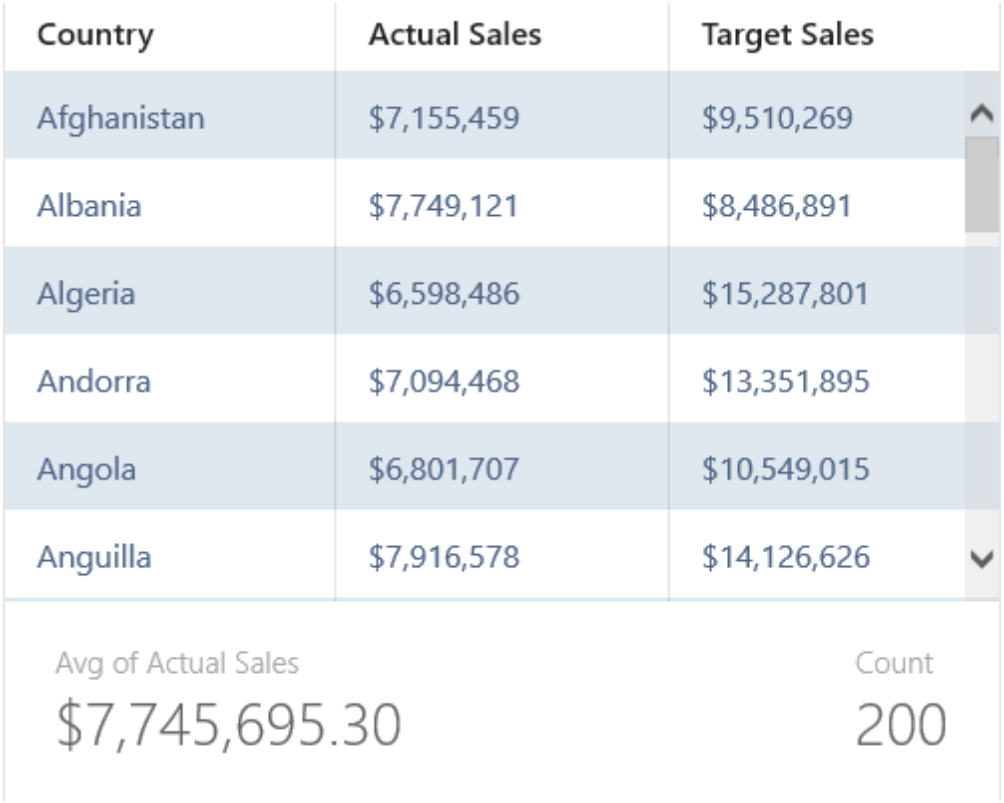
Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Data Summaries > Total Summary

Total Summary Overview

A **total summary** represents a value of an aggregate function calculated over all data rows displayed within a grid. Total summaries are displayed within the Fixed Summary Panel, provided that the DataControlBase.ShowFixedTotalSummary option is enabled. Summaries displayed within the Fixed Summary Panel are not horizontally scrolled and are always visible onscreen, regardless of the corresponding column's position and visibility.



Displaying Total Summaries

The grid stores its total summaries within the GridControl.TotalSummary collection.

To create a total summary item at design time, use the **TotalSummary Collection Editor**.

Total summary items are displayed within the Fixed Summary Panel by default. Use the SummaryItemBase.Alignment property to specify whether to align the summary item to the Left or Right. If this property is set to 'Default', a summary item is displayed on the right of the Fixed Summary Panel.

Xaml

```
<Grid:GridControl.TotalSummary>
    <Grid:GridSummaryItem FieldName="Total" SummaryType="Max" Alignment="Left" />
</Grid:GridControl.TotalSummary>
```

© 2018 Developer Express Inc.

To create a total summary in code, create a new instance of the SummaryItemBase class, specify its SummaryItemBase.FieldName and SummaryItemBase.SummaryType properties, and add it to the GridControl.TotalSummary collection.

C#

```
using DevExpress.Data;
using Windows.UI.Xaml.Controls;
// ...
grid.TotalSummary.Add(SummaryItemType.Count, "ProductName");
grid.TotalSummary.Add(SummaryItemType.Max, "UnitPrice").DisplayFormat = "Max: {0:c2}";
grid.TotalSummary.Add(SummaryItemType.Average, "UnitPrice").DisplayFormat = "Avg: {0:c2}";
```

Obtaining Summary Values

To obtain a total summary value, use the DataControlBase.GetTotalSummaryValue method.

Use the DataControlBase.FixedSummariesLeft and DataControlBase.FixedSummariesRight properties to obtain total summaries aligned to the Left or to the Right, respectively.

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Data Summaries > Custom Summary

Total summaries provide five predefined aggregate functions. These functions allow you to calculate the following:

- the number of data rows (**Count**)
- the maximum and minimum values (**MAX** and **MIN**)
- the sum and the average value (**SUM** and **AVG**).

If you want to calculate summaries using custom rules, handle the GridControl.CustomSummary event. This event enables you to implement custom aggregate functions, or calculate summary values, using a custom algorithm. Custom summaries allow you to:

- calculate summaries against records that meet specific criteria
- involve multiple data fields in calculations
- implement complex summary functions (e.g. the standard deviation of a population), etc.

General Information

To calculate a summary manually:

- Create a summary item and set its SummaryItemBase.SummaryType property to SummaryItemType.Custom.
- Handle the GridControl.CustomSummary event and implement the summary calculation algorithm.

The GridControl.CustomSummary event fires for each data row involved in summary calculation. The event is also raised before and after processing rows to enable you to perform any initialization and finalization.

The summary calculation consists of the following three stages:

- **Initialization**

The **CustomSummary** event is raised once and the DevExpress.Data.CustomSummaryEventArgs.SummaryProcess property is set to **CustomSummaryProcess.Start**. At this stage you can initialize summary values (e.g. reset internal counters).

- **Calculation**

The **CustomSummary** event occurs multiple times, once for each data row. The **SummaryProcess** property is set to **CustomSummaryProcess.Calculate**. At this stage you should accumulate summaries.

- **Finalization**

The **CustomSummary** event is raised once and the **SummaryProcess** property is set to **CustomSummaryProcess.Finalize**. At this point, calculate a final summary value and assign it to the event parameter's DevExpress.Data.CustomSummaryEventArgs.TotalValue property.

To skip the **Calculation** stage and calculate a custom summary at the **Initialization** or **Finalization** stage, set the event parameter's DevExpress.Data.CustomSummaryEventArgs.TotalValueReady property to **true** at the Initialization stage. This automatically skips the Calculation stage and the Finalization stage starts immediately.

Example

© 2018 Developer Express Inc.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4333.

The following example demonstrates how to use custom summaries to count the total number of empty cells in a certain grid column.

C#

```
 (MainPage.xaml.cs)
using System.Collections.Generic;
using DevExpress.Data;
using DevExpress.UI.Xaml.Grid;
using Windows.UI.Xaml.Controls;
namespace CustomSummary {
    public sealed partial class MainPage : Page {
        List<TestData> list;
        Dictionary<int, bool> selectedValues = new Dictionary<int, bool>();
        public MainPage() {
            this.InitializeComponent();
            list = new List<TestData>();
            for (int i = 0; i < 100; i++) {
                list.Add(new TestData() { Text = "item " + i, Number = i });
                if (i % 3 == 0)
                    list[i].Number = null;
            }
            grid.ItemsSource = list;
        }
        int emptyCellsTotalCount = 0;
        public class TestData {
            public string Text { get; set; }
            public int? Number { get; set; }
        }
        private void grid_CustomSummary(object sender, DevExpress.Data.CustomSummaryEventArgs e) {
            if (((GridSummaryItem)e.Item).FieldName != "Number")
                return;
            if (e.IsTotalSummary) {
                if (e.SummaryProcess == CustomSummaryProcess.Start) {
                    emptyCellsTotalCount = 0;
                }
                if (e.SummaryProcess == CustomSummaryProcess.Calculate) {
                    int? val = (int?)e.FieldValue;
                    if (!val.HasValue)
                        emptyCellsTotalCount++;
                    e.TotalValue = emptyCellsTotalCount;
                }
            }
        }
    }
}
```

```

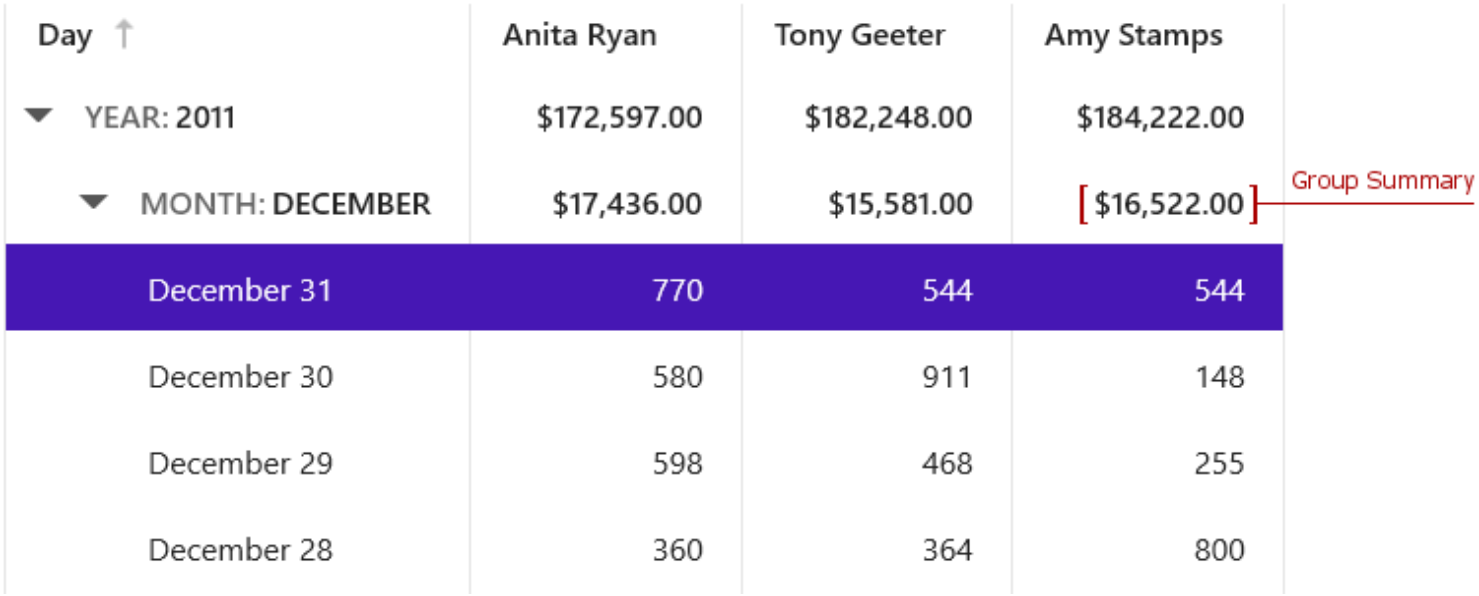
Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Data Summaries > Group Summary

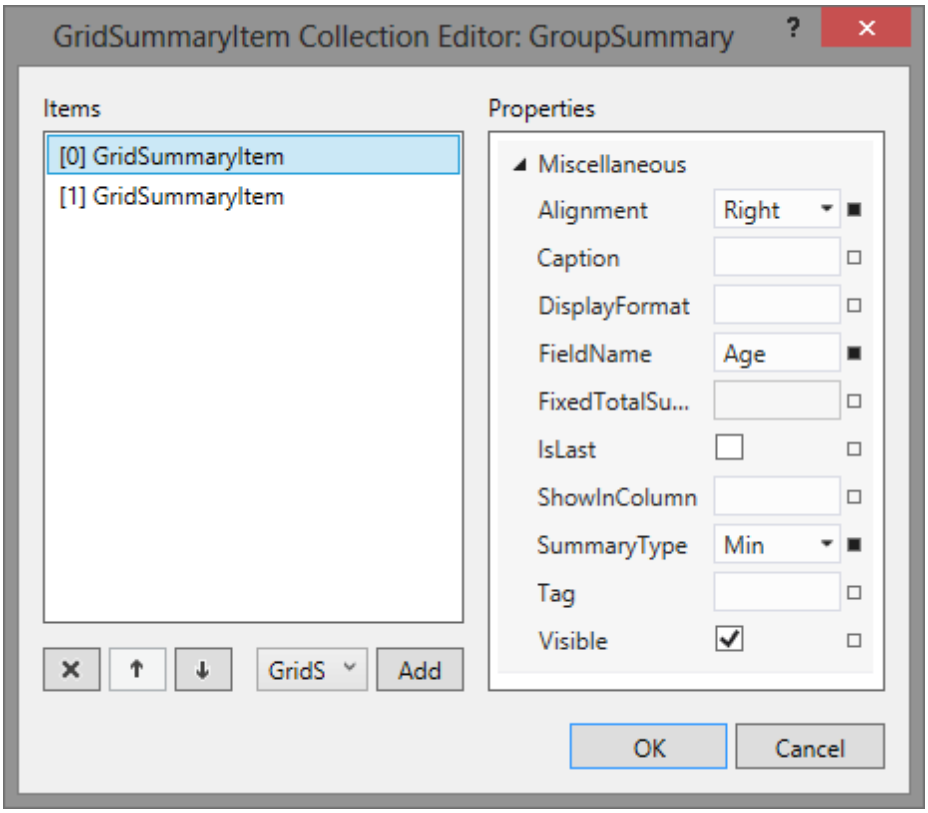
A **group summary** represents a value of the aggregate function calculated over all data rows within a group. Group summaries are displayed within group rows, and are stored within the grid's GridControl.GroupSummary collection.



Displaying Group Summaries

To create a group summary item at design time, use the **GroupSummary Collection Editor**.

© 2018 Developer Express Inc.



Xaml

```
<Grid:GridControl.GroupSummary>
    <Grid:GridSummaryItem DisplayFormat="{}{0:c}" FieldName="UnitPrice" SummaryType="Max" />
</Grid:GridControl.GroupSummary>
```

To display group summaries in code, create a new instance of the SummaryItemBase class, specify its properties and add it to the GridControl.GroupSummary collection.

C#

```
DevExpress.UI.Xaml.Data.GridSummaryItem groupSummaryItem = new DevExpress.UI.Xaml.Data.GridSummaryItem();
groupSummaryItem.FieldName = "UnitPrice";
groupSummaryItem.DisplayFormat = "Max: {0:c2}";
groupSummaryItem.SummaryType = DevExpress.Data.SummaryItemType.Max;
grid.GroupSummary.Add(groupSummaryItem);
```

Align Group Summaries By Columns

By default, group summaries are displayed to a group row's right. To display group summaries under corresponding columns, set the GridControl.GroupSummaryDisplayMode to GroupSummaryDisplayMode.AlignByColumns.

Grouping

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Grouping

Topics in this section:

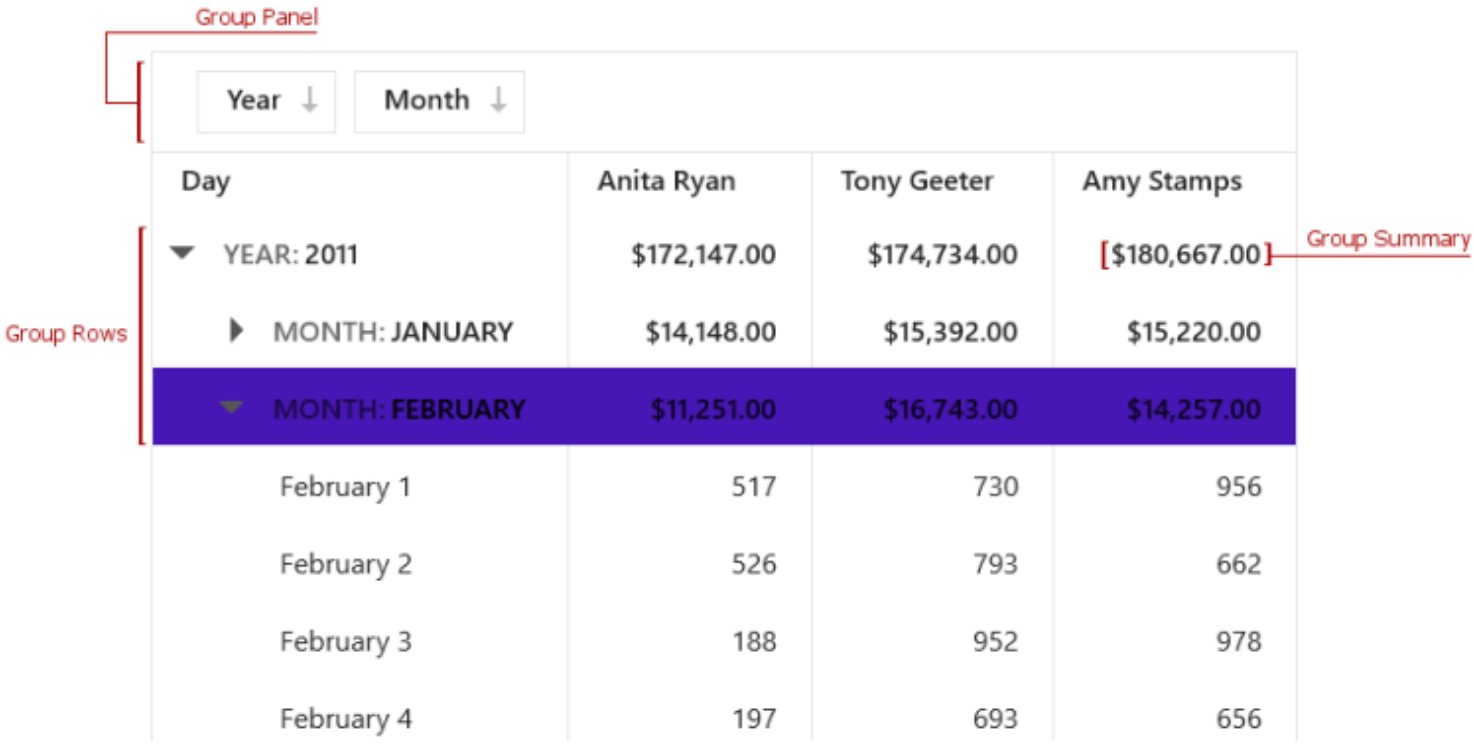
- Grouping Overview
- Expanding and Collapsing Group Rows
- Grouping in Code
- Group Modes

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Grouping > Grouping Overview

Grouping Overview

The Grid Control allows data to be grouped by an unlimited number of columns. When a grid is grouped by a single column, data rows that have identical values in this column are arranged into groups. Each group is identified by a group row. If the grid is grouped by another column, data rows within each group are arranged into second level groups based on the values of the new grouping column.

Group rows are used to organize data rows into a tree when data grouping is applied. Each group row is assigned a unique integer value called a row handle. Group row handles are negative (starting with **-1**).



Rows are always sorted against the grouping columns. If data is grouped against a column that is not sorted, the grid will automatically apply sorting to the column in ascending order.

Grouping columns are not displayed within a grid by default. Their headers are displayed within the Group Panel. To show these columns within a grid, set the GridControlBase.ShowGroupedColumns property to **true**.

Concepts

- Expanding and Collapsing Group Rows
- Grouping in Code
- Group Modes

© 2018 Developer Express Inc.

End-users can expand or collapse group rows by double-clicking them.

Expanding Group Rows

To expand a group row, use the GridControl.ExpandGroupRow method. A group row is specified by its handle. All group rows can be expanded using the GridControl.ExpandAllGroups method.

Before a group row is expanded, the GridControl.GroupRowExpanding event is raised, allowing you to cancel the action. For instance, you can prevent an end-user from expanding individual group rows. After a group row has been expanded, the GridControl.GroupRowExpanded event is raised.

To identity whether a group row is expanded, use the GridControl.IsGroupRowExpanded method.

Collapsing Group Rows

To collapse the specified group row, use the GridControl.CollapseGroupRow method. All group rows can be collapsed using the GridControl.CollapseAllGroups method.

Before a group row is collapsed, the GridControl.GroupRowCollapsing event is raised, allowing you to cancel the action. After a group row has been collapsed, the GridControl.GroupRowCollapsed event is raised.

Grouping

To group data by the values of the specified column at runtime, do one of the following:

- Specify the column's GridColumnBase.GroupIndex property. This property specifies whether or not the column takes part in grouping, and at which level it takes part in grouping.

C#

```
grid.Columns["UnitPrice"].GroupIndex = 0;
```

- Use the GridControl.GroupBy method.

C#

```
grid.GroupBy("UnitPrice");
```

Ungrouping

To ungroup data by the values of a single column, do one of the following:

- Set the column's GridColumnBase.GroupIndex property to **-1**.
- Call the GridControl.UngroupBy method.

To ungroup the grid, use the GridControl.ClearGrouping method.

Group Modes

When grouping by date/time values, only the date portion of the value is taken into account by default, while the time portion is ignored. So rows that contain matching date portions, but different time portions, in a grouping column are combined into a single group. If grouping columns contain other data types, the default grouping logic is used. In this instance, rows are combined into a single group if they have a matching value in a grouping column.

The **Interval Grouping** feature allows you to change the default logic, especially for columns containing date/time values. For example, data rows can be arranged by the month or year portion of a date/time value, while text columns can be grouped alphabetically by the first characters. To specify the required grouping mode, use the column's GridColumnBase.GroupInterval property.

© 2018 Developer Express Inc.

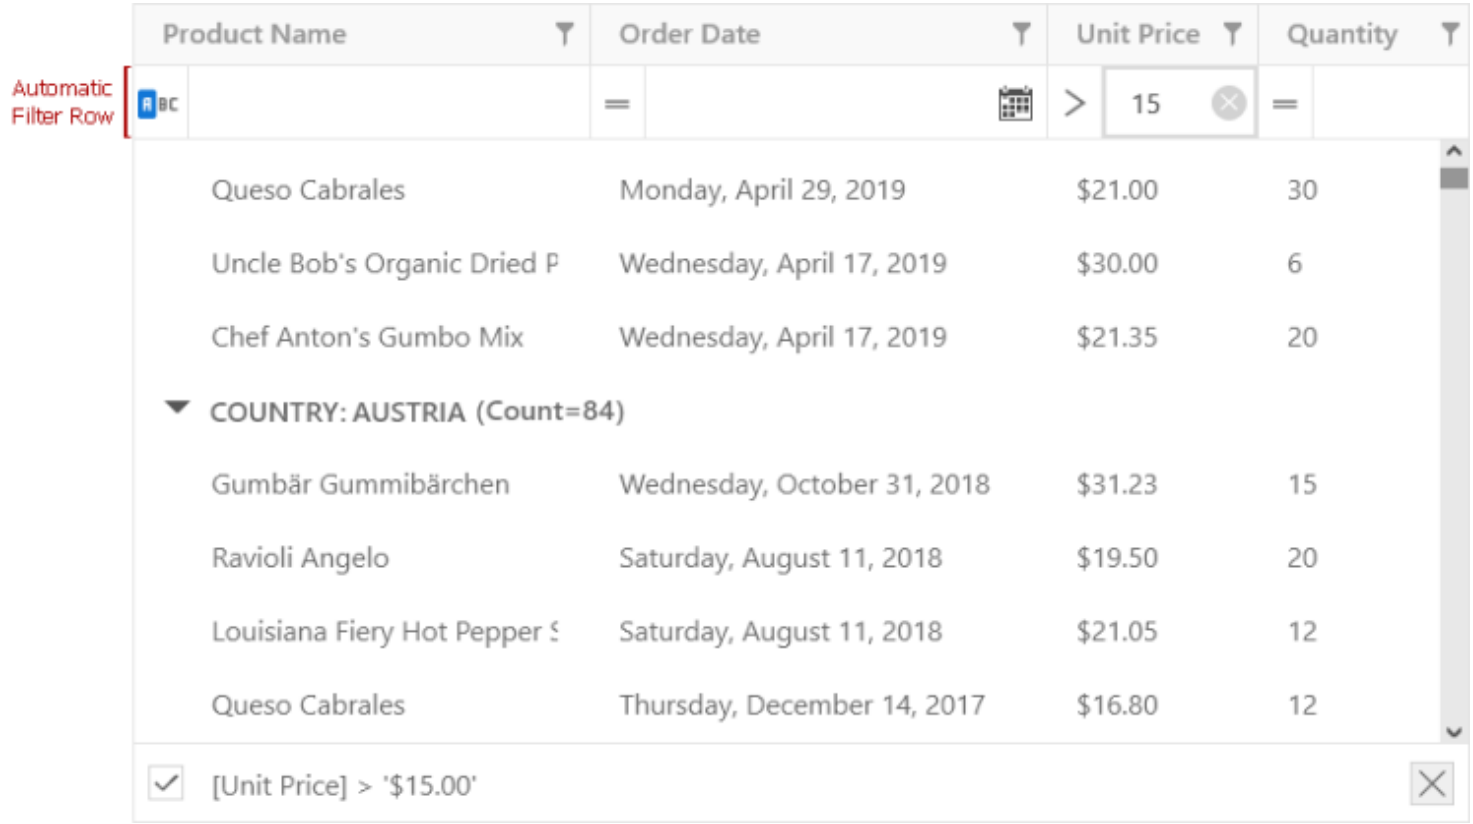
Filtering and Searching

Topics in this section:

- Automatic Filter Row
- Searching Rows
- Filtering in Code
- Filter Expressions
- Filter Dropdown

The **automatic filter row** allows end-users to filter data on the fly by typing text directly into the row. When an end-user types the text within the row, a filter condition is automatically created based upon the values entered and applied to the column.

By default, the auto-filter row is hidden. It can be activated by setting the GridControl.ShowAutoFilterRow property to **true**.



By default, when an end-user modifies the text within the auto filter row's cell, the filter condition for this column is immediately updated. To disable automatic updates, set the column's ColumnBase.ImmediateUpdateAutoFilter property to **false**. In this instance, an end-user should press the Enter key or move focus to another cell to force the updates.

To remove the filter, clear the text from the auto-filter row.

Note

When the ColumnBase.ShowCriteriaInAutoFilterRow property is set to **True**, the GridControl does not take into account the ColumnBase.AutoFilterCondition property value. Instead, it uses the ColumnBase.AutoFilterCriteria property. So, to apply the required condition, use the ColumnBase.AutoFilterCriteria property.

Auto-Filter Row Settings

- **Availability**

© 2018 Developer Express Inc.

Columns provide the ColumnBase.AllowAutoFilter property that specifies whether their values can be filtered using the automatic filter row. If this property is set to **false**, the corresponding cell within the automatic filter row is disabled.

- **Comparison Operator Type**

A column's ColumnBase.AutoFilterCondition property allows you to specify the comparison operator type.

- **Row Data**

A cell's value can be obtained using the corresponding column's ColumnBase.AutoFilterValue property.

- **Filter Criteria Selector**

ColumnBase.ShowCriteriaInAutoFilterRow property allows you to enable a filter criteria selector. This selector allows end-users to apply the required criteria type to the current column.

- **Filter Condition Update Mode**

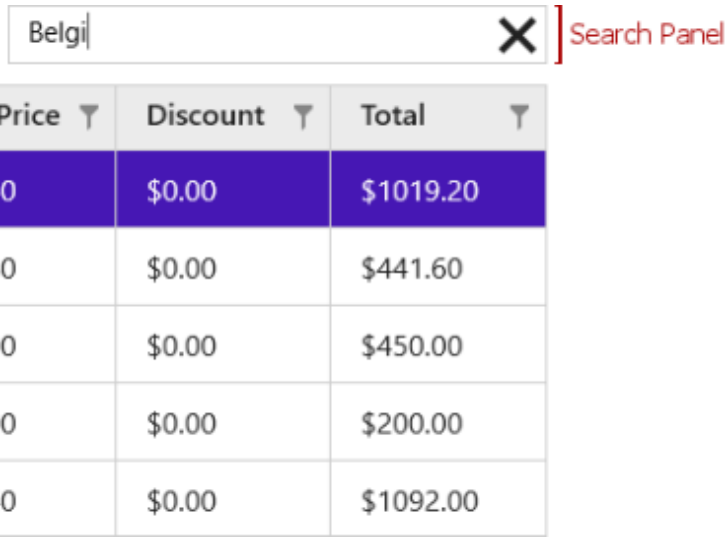
By default the filter condition is updated each time the user modifies text in the auto filter row. You can set the column's ColumnBase.ImmediateUpdateAutoFilter to **false** to disable automatic updating. This way the filter criteria will be applied when an end-user presses the Enter key or moves the focus to another cell.

- **Editor Style**

The ColumnBase.AutoFilterEditorStyle property allows you to specify the style of the auto filter row editor for a specific column.

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Filtering and Searching > Searching Rows

An end-user can easily locate information within the grid via the built-in Search Panel. At runtime, it can be invoked by pressing the **CTRL**+**F** shortcut.



Use the DataControlBase.ShowSearchPanelMode property to manage the Search Panel visibility.

Various options are available to control the display and behavior of the Search Panel. You can specify search columns, choose between automatic and manual search modes, optionally display control buttons, etc. To learn more, see Search Panel.

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Filtering and Searching > Filtering in Code

You can apply filters to the grid in code. Applying a filter to the grid clears all column filters (if any).

Applying a Filter to the Grid

To apply a filter to the grid, use the DataControlBase.FilterCriteria or DataControlBase.FilterString property. Both properties specify the grid's filter, which can consist of multiple conditions applied to multiple columns.

When using the DataControlBase.FilterCriteria property you should create a CriteriaOperator object or its descendant, which represents the filter expression:

C#	

© 2018 Developer Express Inc.

```
grid.FilterCriteria = (
  new BinaryOperator("OrderDate", new DateTime(1995, 1, 1), BinaryOperatorType.Less) &
  new BinaryOperator("UnitPrice", 10, BinaryOperatorType.Less)) |
  ( new BinaryOperator("OrderDate", new DateTime(1996, 1, 1), BinaryOperatorType.GreaterOrEqual) &
  new BinaryOperator("UnitPrice", 100, BinaryOperatorType.GreaterOrEqual));
```

Or you can use the CriteriaOperator.Parse method:

C#

```
grid.FilterCriteria =
    CriteriaOperator.Parse("([OrderDate] < #1/1/1995# AND [UnitPrice] < 10)" +
    " OR ([OrderDate] >= #1/1/1996# AND [UnitPrice] >= 100)");
```

The DataControlBase.FilterString property allows you to specify the filter string:

C#

```
grid.FilterString = "([OrderDate] < #1/1/1995# AND [UnitPrice] < 10)" +
    " OR ([OrderDate] >= #1/1/1996# AND [UnitPrice] >= 100)";
```

You can also use the DataControlBase.MergeColumnFilters method, which combines the specified filter with the grid's current filter using the AND operator.

Clearing Filters

To clear the grid's filter, set the DataControlBase.FilterCriteria property to **null** or the DataControlBase.FilterString property to an empty string.

To clear a column's filter, use the DataControlBase.ClearColumnFilter method.

See Also

Filter Expressions

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Filtering and Searching > Filter Expressions

To filter data, you should create a filter expression(s). The simplest filter has the following syntax: "[Price] = 10". This selects records that have **10** in the **Price** column.

The following table lists the available comparison operators:

Comparison Operator	Description	Example
=	Equal to. The operator can be applied to numeric, date-time, string and Boolean values.	`[ProductID] = 999`
>	Greater than. The operator can be applied to numeric, date-time and string values.	`[ProductName] > 'Uncle'`
<	Less than. The operator can be applied to numeric, date-time and string values.	`[UnitsInStock] < 100`
>=	Greater than or equal to. The operator can be applied to numeric, date-time and string values.	`[BirthDate] >= #01/01/1980#`
<=	Less than or equal to. The operator can be applied to numeric, date-time and string values.	`[CreatedDate] <= #10/2/2006#`
<>	Not equal to.	`[Priority] <> 'Low'`

© 2018 Developer Express Inc.

!=	The operator can be applied to numeric, date-time, string and Boolean values.	
LIKE	Operator 'LIKE'. The operator is used for partial string comparison. It returns TRUE if the value being tested matches the specified pattern. You can use the '%' and '_' symbols as wildcards in patterns. The '%' wildcard substitutes any number of characters. The '_' character is used to represent any single character.	`[ProductName] LIKE '%Sauce%'`
NOT LIKE	Operator 'NOT LIKE'. The operator is used for partial string comparison. It returns TRUE if the value being tested doesn't match the specified pattern. See the description of the LIKE operator for more information.	`[IssueSubject] NOT LIKE 'Help:%'`
IS NULL	Checks whether the value being tested is the NULL value.	`[Region] IS NULL`
IS NOT NULL	Checks whether the value being tested is not the NULL value.	`[Region] IS NOT NULL`

Note

String constants must be enclosed within single quote characters. If a single quote character needs to be included as a literal to a filter it must be doubled. Example:

```
[ProductID] LIKE 'Uncle Bob''s%'
```

Note

Date-time constants must be wrapped with the '#' character and represented using a culture-independent (invariant) format.

```
[CreatedDate] <= #07/30/2008#
```

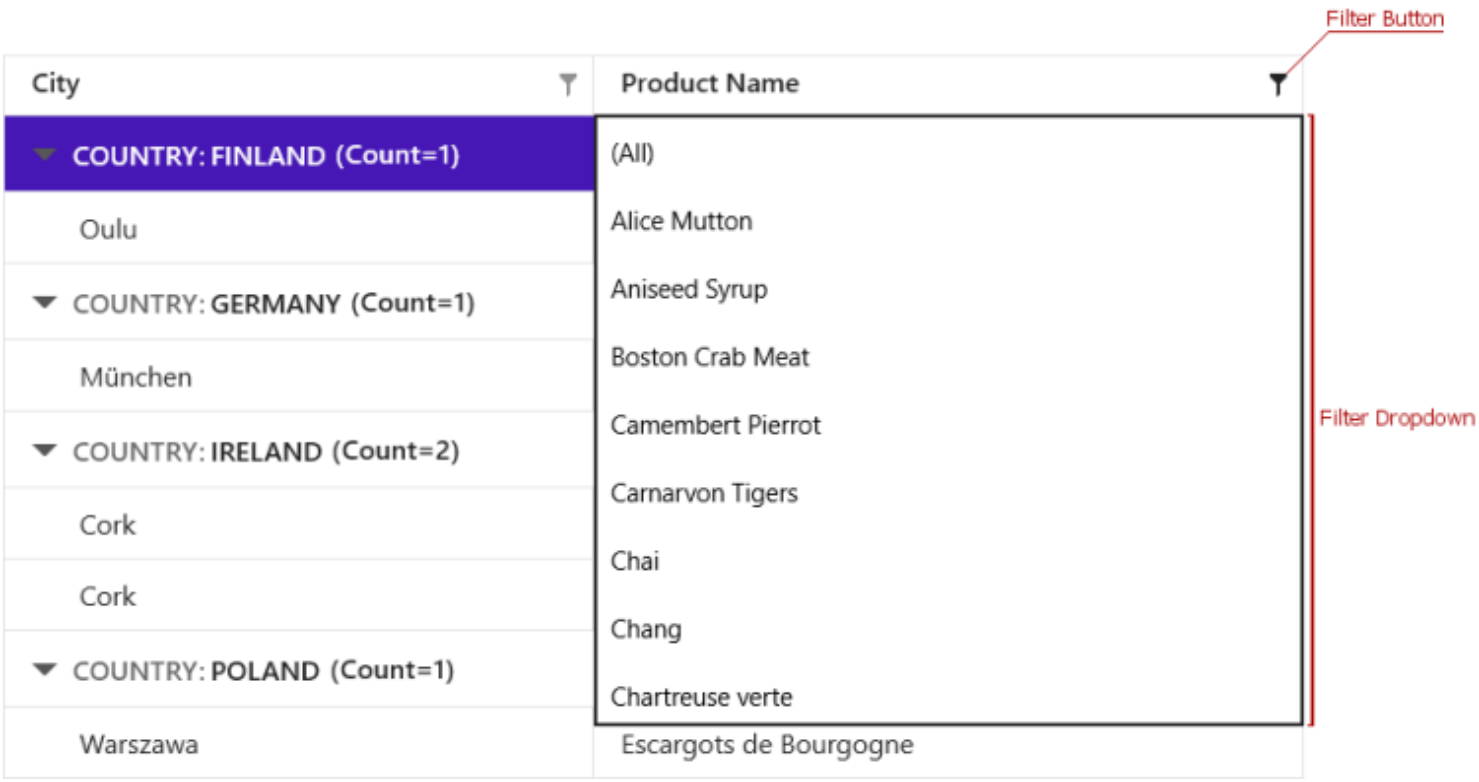
Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Filtering and Searching > Filter Dropdown

Overview

A column's filter dropdown provides runtime filtering capabilities. To filter data against a column, an end-user should invoke the column's filter dropdown and specify a filter criteria. This automatically filters data (displays records that have the selected value(s) in the current column). Filter dropdown lists also display predefined items (All), (Blanks) and (Non Blanks).

To show a filter dropdown, an end-user should click the filter button within a column header.

© 2018 Developer Express Inc.



Availability

An end-user can invoke a column's Filter Dropdown if the grid's DataControlBase.AllowColumnFiltering property is set to **true**. Grid columns provide the ColumnBase.AllowColumnFiltering option that enables you override the default behavior specified by a grid. For instance, you can set a column's ColumnBase.AllowColumnFiltering property to DefaultBoolean.False and prevent an end-user from filtering data by its values using the filter dropdown.

Sorting

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Sorting

Topics in this section:

- Sorting Overview
- Sorting in Code
- Sorting Modes and Custom Sorting

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Sorting > Sorting Overview

Overview

To sort data against a column or to change a column's sort order, an end-user can click its header. The column's current sort order is indicated by a sort glyph (a small arrow displayed at the right of the column header). If the data is sorted in ascending order, the sort glyph is displayed as an up-arrow. When sorting in descending order, the sort glyph is displayed as a down-arrow.

If sorting isn't applied, clicking the column's header sorts data by its values in descending order. Subsequent clicks reverse the current sort order and clear the sorting. A regular click on a column header clears the sort settings on any other columns. To preserve the existing sort settings of other columns, hold the SHIFT key down while clicking or set the DataControlBase.PreserveSorting property to **true**. This can be useful when it is necessary to sort against multiple columns.

To clear a column's sorting, click its header while pressing the CTRL key.

Availability

To allow end-users to sort data, set the grid's DataControlBase.AllowSorting property to **true**. Individual columns provide the ColumnBase.AllowSorting property, which allow the default behavior specified by the grid to be overridden. For example, this prevents an end-user from sorting data by the values of individual columns.

Sorting in code is always allowed.

Concepts

- Sorting in Code
- Sorting Modes and Custom Sorting

Examples

- How to: Implement Custom Sorting

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Sorting > Sorting in Code

Sorting

The following methods and properties can be used to sort data:

- A column's ColumnBase.SortOrder property specifies the column's sort order. Set it to ColumnSortOrder.Ascending or ColumnSortOrder.Descending.

C#

```
grid.Columns["ProductName"].SortOrder = ColumnSortOrder.Ascending;
```

- Set a column's ColumnBase.SortIndex property to a non-negative value. This automatically sorts its values in ascending order.
- Use the grid's GridControl.SortBy method.

Unsorting

To unsort data by the values of a single column, do one of the following:

- Set the column's ColumnBase.SortOrder property to ColumnSortOrder.None.
- Set the column's ColumnBase.SortIndex property to **-1**.
- Use the grid's GridControl.SortBy method:

© 2018 Developer Express Inc.

C#

```
grid.SortBy(grid.Columns["ProductName"], ColumnSortOrder.None);
```

To clear the sorting applied to the grid, use the DataControlBase.ClearSorting method.

Note

If grouping is applied, the DataControlBase.ClearSorting method preserves sorting applied to grouping columns, because group rows are always sorted.

Sorting Events

When sorting data, the grid does the following:

- Raises the GridControl.StartSorting event.
- Sorts data.
- Raises the GridControl.EndSorting event.

Note

Group rows are always sorted. The **StartSorting** and **EndSorting** events are also raised before and after data is grouped.

Windows 10 App Controls > Controls > Data Grid > Concepts > Data Management > Sorting > Sorting Modes and Custom Sorting

Overview

The Grid Control supports data sorting by cell values and display text. For each column, you can specify how data should be sorted - by the edit or display values, or using custom logic. To specify the required sort mode, use the ColumnBase.SortMode property.

- **Sorting by Edit Values** (Default)

Sorts a column's data by its edit values. To enable this mode, set the ColumnBase.SortMode property to ColumnSortMode.Value.

- **Sorting by Display Text**

Sorts a column's data by its display text (the strings displayed within data cells). To enable this mode, set the ColumnBase.SortMode property to ColumnSortMode.DisplayText.

- **Custom Sorting**

Enables you to implement custom sorting rules. Handle the GridControl.CustomColumnSort event to do this. To enable this mode, set the ColumnBase.SortMode property to ColumnSortMode.Custom.

Custom Sorting

To sort column values using custom logic, set a column's ColumnBase.SortMode property to ColumnSortMode.Custom, and handle the GridControl.CustomColumnSort event.

When this event is fired, two rows should be compared. The column being processed is specified by the **Column** parameter. The **Value1** and **Value2** parameters identify the values of the rows within this column. The result of the custom comparison should be set to the **Result** parameter as follows:

- **-1** if the first row should be positioned above the second row when data is sorted in ascending order. When data is sorted in descending order, the first row will be positioned below the second row.
- **1** if the first row should be positioned below the second row when data is sorted in ascending order. When data is sorted in descending order the first row will be positioned above the second row.
- **0** to indicate that the rows are equal. In this case, the rows will be arranged within a grid according to their indices in the data source.

The event parameter's **Handled** property should be set to **true** if the comparison operation was handled. Leave this parameter set to **false** to invoke the default comparison mechanism after your event handler has finished. In this instance, the result of the custom comparison operation is ignored.

Example: How to Implement Custom Sorting

Show Me

© 2018 Developer Express Inc.

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4340.	

This example demonstrates how to implement custom sorting in the Grid Control. To do this, handle the GridControl.CustomColumnSort event, assign your custom sorted list to the e.Result property and set the e.Handled property to True.

C#

```

Data Editing

The grid control supports inplace cell editing. There are five column types to display specific data types (Boolean, Date-Time, Numeric, Lists and Text), one column type that provides masking capabilities for text values, and one column type for custom data presentation via templates. Cell values are edited using data editors. Each column type stores specific settings responsible for the data editor's functionality. A cell editor is created when an end-user starts to edit a cell value, and is automatically destroyed when editing is completed. This dramatically increases application performance.

To enable data editing, set the grid's DataControlBase.AllowEditing property to **true** and set the DataControlBase.NavigationStyle property to GridControlNavigationStyle.Cell. Columns provide the ColumnBase.AllowEditing property, which allows you to override the behavior specified by the grid, and disable data editing for individual columns.

Note
Data editing is enabled by default.

Column Types

There are five column types to present specific data types (Boolean, Date-Time, Numeric, Lists and Text), one column type that provides masking capabilities and one column type for custom data presentation. The column types are listed and described in the table below.

Column Type	Description
Text GridTextColumn	Presents data as text. Cell values are edited using an embedded text editor that ships with the Editors Library (TextEdit).
Numeric GridSpinEditColumn	Presents numeric values. Cell values are edited using an embedded spin editor that ships with the Editors Library (SpinEdit).
Boolean GridCheckBoxColumn	Presents Boolean values. Cell values are edited using a standard check box (Windows.UI.Xaml.Controls.CheckBox).
List GridComboBoxColumn	Presents lists. Cell values are edited using a standard combo box (Windows.UI.Xaml.Controls.ComboBox).
Date-Time GridDateColumn	Presents Date-Time values. Cell editors are edited using an embedded date editor that ships with the Editors Library (DateEdit).
Mask GridMaskColumn	Presents data as text and provides masking capabilities. Cell editors are edited using an embedded text editor that ships with the Editors Library (TextEdit).
Custom GridTemplateColumn	Provides templates that allow you to implement custom data representation.

Concepts

Showing and Hiding Editors

Adding Rows

© 2018 Developer Express Inc.

Adding Rows

Requirements

Adding rows is only possible if the grid's data source allows adding data items. For example, if the grid is bound to a data source that implements the System.ComponentModel.IBindingList interface, the capability to add rows depends on the boolean **IBindingList.AllowNew** setting.

New Item Row

The **New Item Row** allows end-users to add new records. It can be displayed above or below all data and group rows depending on the GridControl.NewItemRowPosition property value. By default, the **New Item Row** is hidden (the GridControl.NewItemRowPosition property is set to NewItemRowPosition.None).

When an end-user starts editing the **New Item Row**, the GridControl.InitNewRow event is raised. You can handle this event to initialize required fields within the new record. For instance, you can assign a unique value to the key field and/or assign default field values.

Handle the GridControl.AddingNewRow event to customize the new data item initialization.

The grid's DataControlBase.AllowEditing and DataControlBase.NavigationStyle properties do not affect the **New Item Row**.

Adding Rows in Code

The GridControl.AddNewRow method adds an empty row to the grid. If the **New Item Row** is enabled, this method moves focus to this element. Otherwise, the new record is temporarily placed below existing records. After an end-user has entered cell values and the row has been accepted, the new row moves to its final location according to the current filtering, grouping and sorting settings.

© 2018 Developer Express Inc.

Showing and Hiding Editors

Note

End-users can invoke cell editors and change cell values if the grid's DataControlBase.AllowEditing property is set to **true** and the DataControlBase.NavigationStyle property is set to GridControlNavigationStyle.Cell.

End-users can switch the grid to edit mode by clicking the required cell, or by pressing the **ENTER** or **F2** key. This activates the focused cell's inplace editor, allowing the user to modify the focused cell value. To save the changes made and close the editor, the end-user should press **ENTER**, or move cell focus to another cell. Pressing **ESC** closes the editor, discarding all changes made.

Cell editors can also be activated and closed in code.

To programmatically activate the cell's editor, you should focus the cell and call the DataControlBase.ShowEditor method. After the editor is shown, the grid fires the GridControlBase.ShownEditor event.

There are two methods that hide the active editor. The DataControlBase.CommitEditing method hides the active editor, saving the changes made. The DataControlBase.HideEditor method hides the active editor, but discards the changes. To save changes to a data source without closing the active editor, use the DataControlBase.PostEditor method.

After the editor is closed, the grid fires the GridControlBase.HiddenEditor event.

Validation

Topics in this section:

- Editor Validation
- Row Validation

© 2018 Developer Express Inc.

Editor Validation

When an end-user modifies a focused cell's value and tries to save changes (by pressing the ENTER key or moving focus to another cell), the grid validates a new value. First, this value is validated by the editor itself. Then, the column's ColumnBase.Validate event is raised to allow you to manually validate the cell's value. Note that this event is not fired when cell values are changed in code.

- **Validating a New Value**

The event parameter's **Value** property returns the focused cell's new value that should be validated. The old value is returned by the **CellValue** property. If the new value meets the validation rules, set the event parameter's **IsValid** property to **true**. Otherwise, set the **IsValid** property to **false**. In this case, the cell focus cannot be moved to another cell until the cell's value is corrected.

- **Indicating Errors**

If you've set the **IsValid** property to **false**, an error icon is displayed within the edited cell. Use the event parameter's **ErrorType** property to specify the required icon.

© 2018 Developer Express Inc.

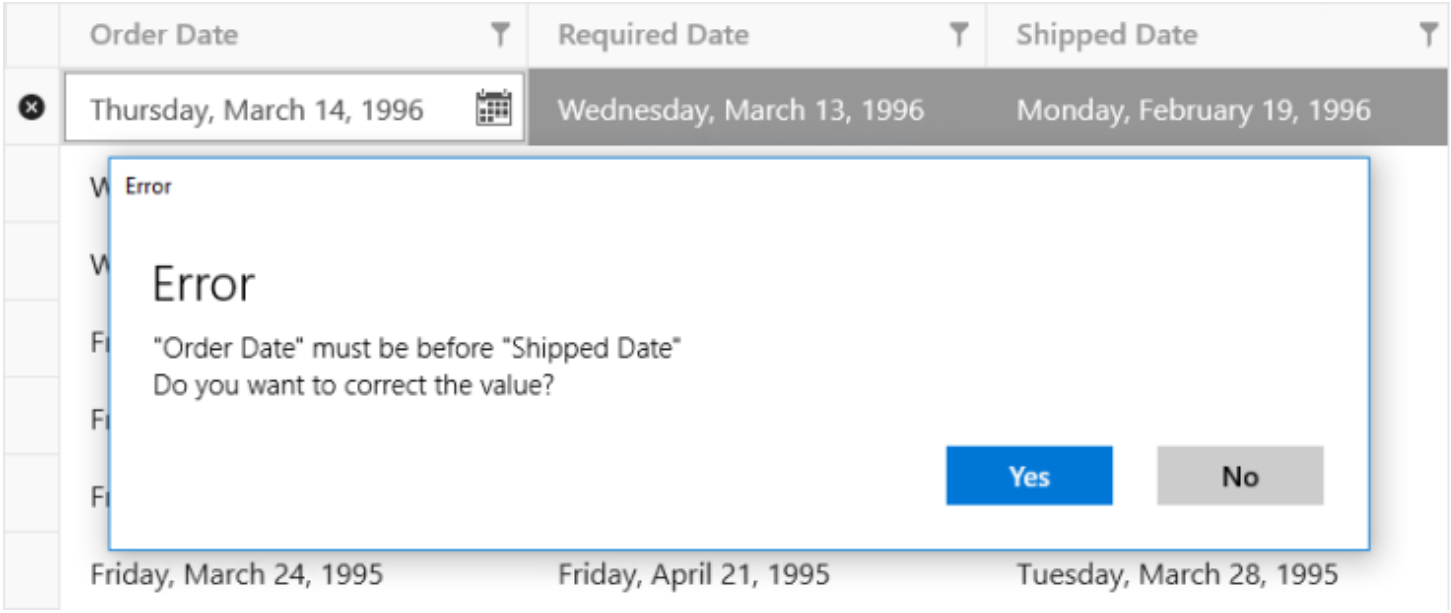
Row Validation

This topic describes how to check validity of data entered by end-users into a data row. This is useful when the integrity of row data is important (for instance, when values in some columns depend on values in others).

Row validation is performed in the GridControl.ValidateRow event handler when a row is about to lose focus. To manually force row validation, call the DataControlBase.CommitEditing method.

The processed row is returned by the event parameter's **Row** property. Its handle is returned by the **RowHandle** property. After cell values have been obtained, you can verify whether the values meet your validity criteria. If the row fails validation, set the event's **IsValid** parameter to **false**. Otherwise, keep the **IsValid** parameter set to **true**.

By default, if the row contains invalid data, the error message box is displayed. Clicking the **Yes** button returns focus to the row. This allows an end-user to correct row values. If the **No** button is clicked, the row's changes are discarded and focus can be moved from the row. Note that the rollback occurs only if objects that represent rows implement the **System.ComponentModel.IEditableObject** interface.



It is possible to provide an additional error description via the event's **ErrorText** parameter. The string assigned to this parameter will be displayed in the error message box followed by the "Do you want to correct the value?" string. To change the error window's default caption, use the **WindowCaption** property.

To override the default error presentation, handle the GridControlBase.InvalidRowException event that occurs after the GridControl.ValidateRow event. Use the event parameter's InvalidRowExceptionEventArgs.ExceptionMode property to specify the action performed in response to entering an invalid value. You can display a message box with an error description, suppress any action, throw an exception or discard new data, and revert to an old value.

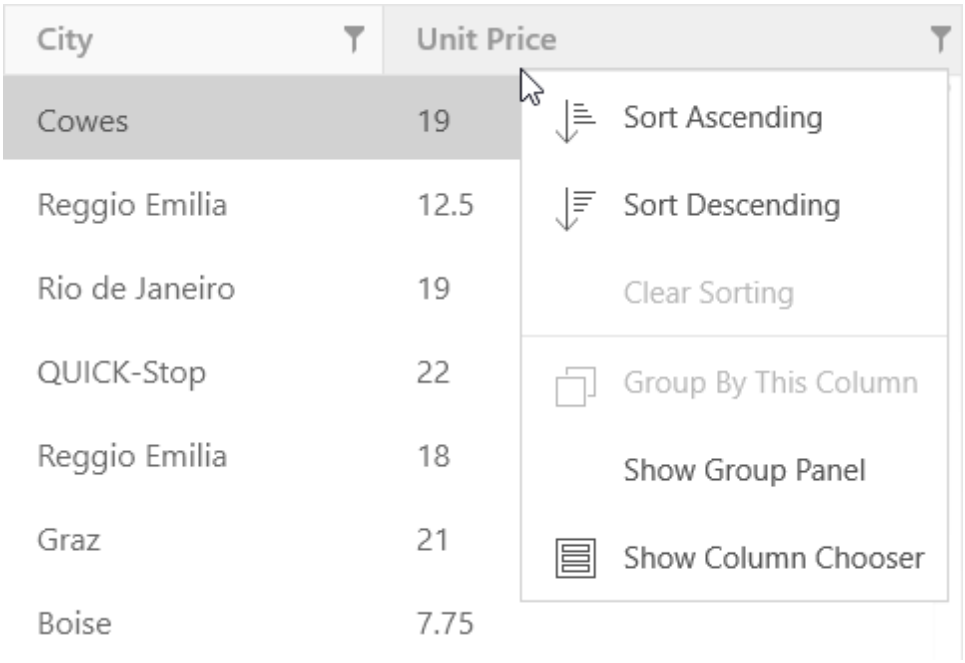
© 2018 Developer Express Inc.

Context Menus

Windows 10 App Controls > Controls > Data Grid > Concepts > Context Menus

The Universal Grid Control provides context menus that can be invoked by right-clicking the grid's visual elements and provide the ability to perform actions linked to these elements.

By default, the grid provides a column context menu that is invoked by right-clicking a column header and allows end-users to show/hide the Group Panel and Column Chooser and manage sorting and grouping.



Below is a list of properties that allow you to specify the grid's context menus for certain visual elements.

Property	Elements
GridControl.ColumnMenu	Column headers
GridControl.RowCellMenu	Data cells, rows and the Row Indicator Panel
GridControl.GridMenu	Empty space within the grid
GridControl.GroupPanelMenu	Group Panel

To customize context menus' content and behavior, handle the following events: GridControl.ContextMenuOpening, GridControl.ContextMenuOpened, GridControl.ContextMenuClosed.

© 2018 Developer Express Inc.

Data Scrolling

Topics in this section:

- Data Scrolling Overview
- Moving Row Focus

© 2018 Developer Express Inc.

Data Scrolling Overview

The grid control provides multiple options for optimized record scrolling each designed for specific use cases.

- **UI Virtualization**

This feature addresses issues involving data sets with many rows. The Grid Control processes data on an as-needed basis. It creates only those data items that are actually visible on the screen. Once generated, these items are then reused when the user scrolls the grid vertically. The content outside the grid area is not processed, except for buffer areas for which size is specified by the DataControlBase.VirtualizingCacheHeight property. Buffer areas make the loading process visually undetectable. As a result, less memory is used, and less time is required for the grid's initial load.

- **Freeze Scrollbar Position on Data Sorting**

By default, changing the order of rows automatically scrolls the grid to make the focused row visible onscreen. The DataControlBase.AutoScrollOnSorting option allows you to deactivate automatic scrolling to the focused row when sorting data. In this instance, a scroll bar's position does not change when rows are reordered.

© 2018 Developer Express Inc.

Moving Row Focus

Availability

Rows can be focused if the DataControlBase.NavigationStyle property is not set to GridControlNavigationStyle.None. To specify the focused row, use the DataControlBase.SelectedItemHandle property. If the specified row is not visible on the screen, the grid is automatically scrolled to make the focused row visible.

Moving Row Focus

The focused row is specified by its handle using the DataControlBase.SelectedItemHandle property. A grid provides multiple methods that you can use to move row focus. These methods are listed and described below:

Method	Description
DataControlBase.MoveFirstRow	Moves focus to the first visible row or card within the grid.
DataControlBase.MovePrevPage	Moves focus backward by the number of rows or cards displayed onscreen within the grid.
DataControlBase.MovePrevRow	Moves focus to the row or card preceding the one that is currently focused.
DataControlBase.MoveNextRow	Moves focus to the row or card following the one that is currently focused.
DataControlBase.MoveNextPage	Moves focus forward by the number of rows or cards displayed onscreen within the grid.
DataControlBase.MoveLastRow	Moves focus to the last visible row or card within the grid.
DataControlBase.MoveSelectedItem	Moves focus to the specified row.

All of these methods move focus between visible rows. These methods do not expand collapsed groups.

The DataControlBase.SelectedItemChanged event is raised after the focused row has been changed.

The number of visible rows is returned by the DataControlBase.VisibleRowCount property. Note that rows contained within collapsed group rows are not taken into account.

© 2018 Developer Express Inc.

Visual Elements

The topics in this section describe the control elements that you see on screen. Each topic contains a screenshot that outlines the described element and a brief overview of the element's purpose. Additionally, each topic contains a list of the settings that specify the element's visibility, content and appearance.

The following visual elements are available:

- Auto Filter Row
- Column Header Panel
- Column Chooser
- Fixed Summary Panel
- Row Indicator Panel
- Group Panel
- Group Row
- New Item Row
- Filter Panel
- Search Panel

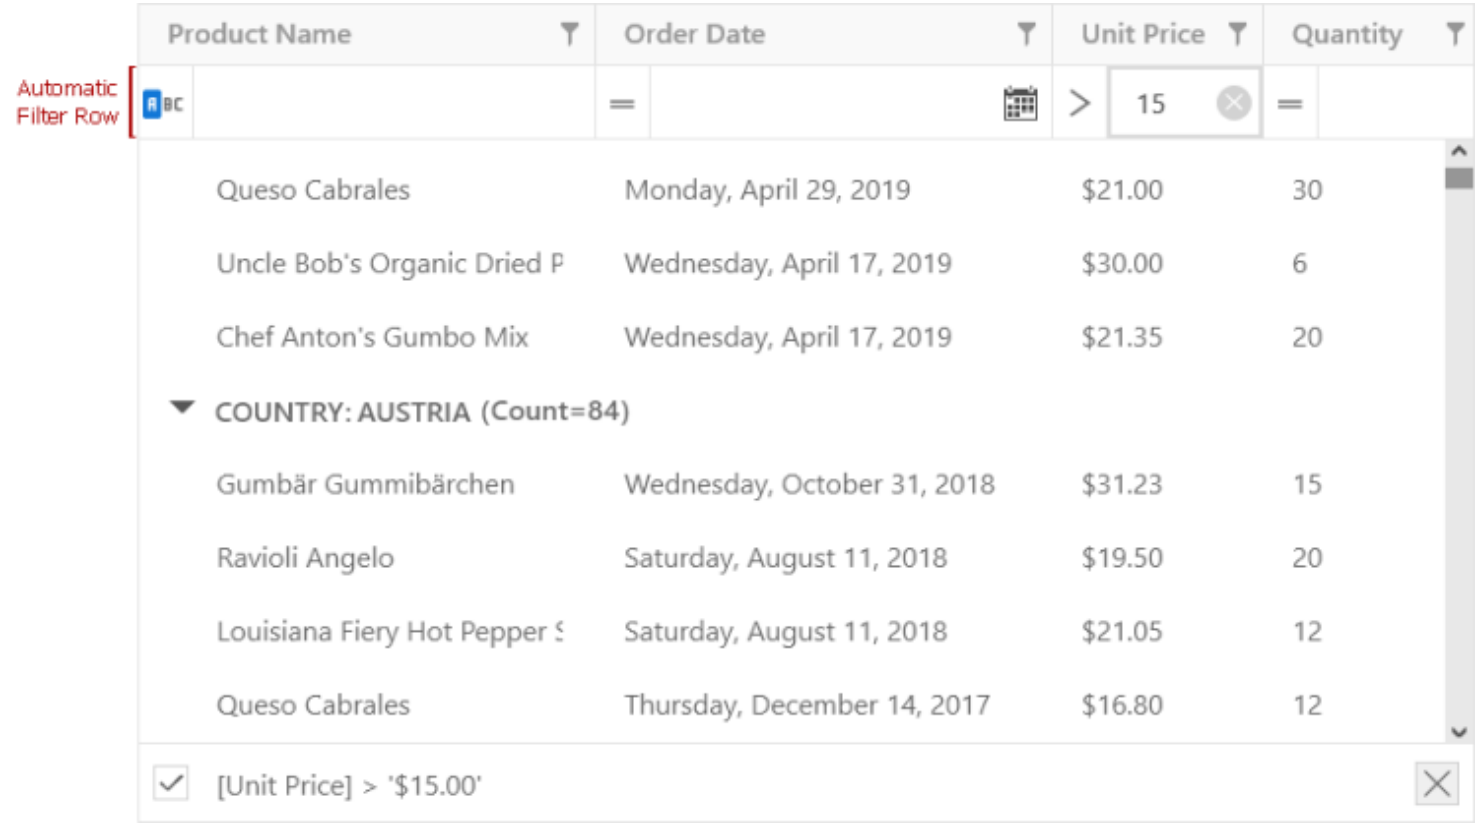
© 2018 Developer Express Inc.

Auto Filter Row

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Auto Filter Row

The **Automatic Filter Row** allows data to be filtered on the fly by typing text within the row. When an end-user types text within the row, a filter condition is automatically created based upon the value entered, and this is applied to the focused data column.

Setting the ColumnBase.ShowCriteriaInAutoFilterRow property to **true** makes the filter criteria selector available to the end-users. The filter criteria selector allows the end-users to choose the desired filter criteria from the drop-down list.



The table below lists the main properties that affect element behavior and appearance.

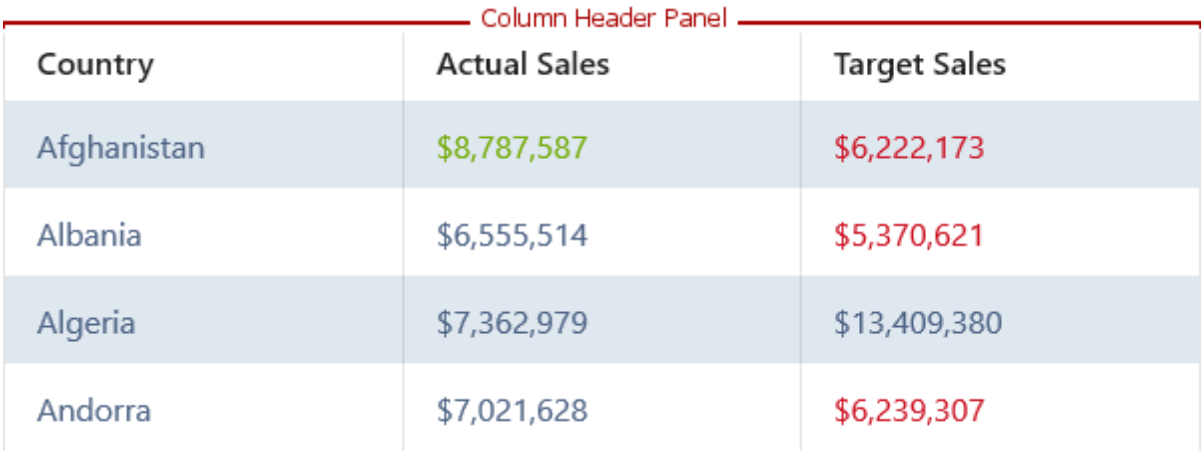
Characteristics	Members
Visibility	GridControl.ShowAutoFilterRow
Style	ColumnBase.AutoFilterEditorStyle
Availability and Behavior	ColumnBase.AllowAutoFilter, ColumnBase.ImmediateUpdateAutoFilter
Criteria Selector Availability	ColumnBase.ShowCriteriaInAutoFilterRow
Condition	ColumnBase.AutoFilterCondition

© 2018 Developer Express Inc.

Column Header Panel

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Column Header Panel

The **Column Header Panel** displays the headers of visible columns.



The table below lists the main properties affecting element behavior and appearance.

Characteristics	Members
Visibility	DataControlBase.ShowColumnHeaders

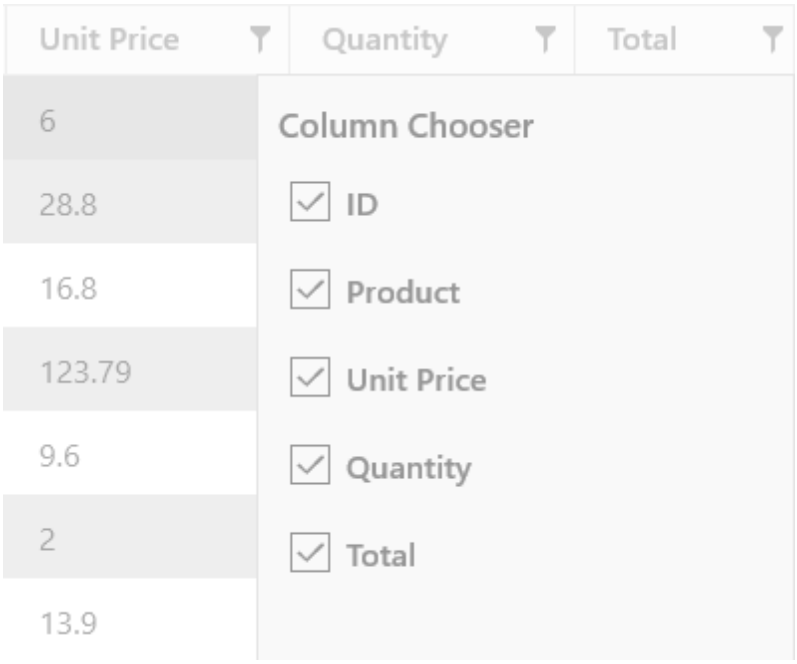
© 2018 Developer Express Inc.

Column Chooser

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Column Chooser

The Column Chooser can be invoked using the column context menu and allows end-users to show, hide and rearrange columns at runtime.

To show or hide a column, select or deselect the checkbox next to its header. To rearrange columns, drag a column header.



The ColumnBase.Visible property determines whether the column is hidden. If you don't want to display a hidden column within the Column Chooser, set its ColumnBase.ShowInColumnChooser property to **false**.

The ColumnBase.ColumnChooserHeaderCaption property allows you to specify the column header within the Column Chooser.

To invoke the Column Chooser in code, use the GridControlCommands.ShowColumnChooser command.

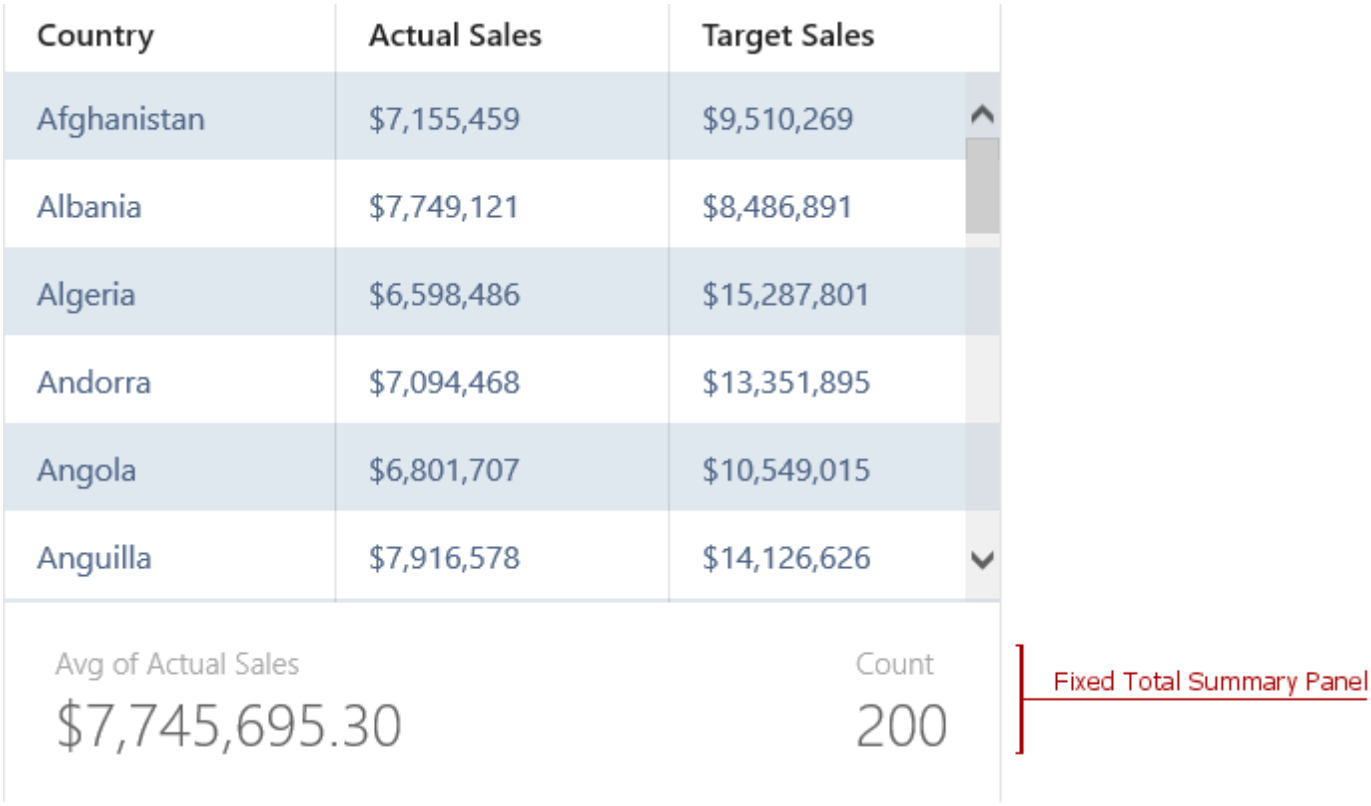
© 2018 Developer Express Inc.

Fixed Summary Panel

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Fixed Summary Panel

The **Fixed Summary Panel** is displayed at the bottom and shows fixed total summaries.

Fixed total summaries can be displayed on the left or right of the **Fixed Summary Panel**. The position does not depend on the corresponding column's position and is specified by the SummaryItemBase.Alignment property.



The table below lists the main properties affecting element behavior and appearance.

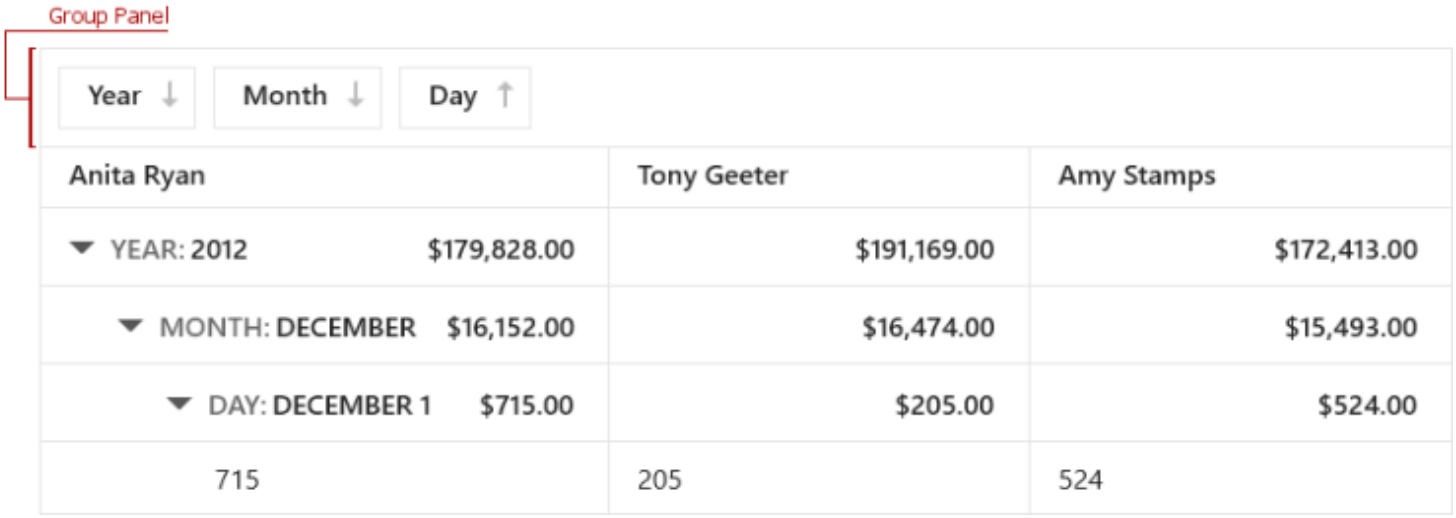
Characteristics	Members
Visibility	DataControlBase.ShowFixedTotalSummary
Template	DataControlBase.FixedTotalSummaryItemTemplate

© 2018 Developer Express Inc.

Group Panel

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Group Panel

The **Group Panel** displays the titles of group columns. You can sort group rows by clicking these titles.



The table below lists the main properties affecting element behavior and appearance.

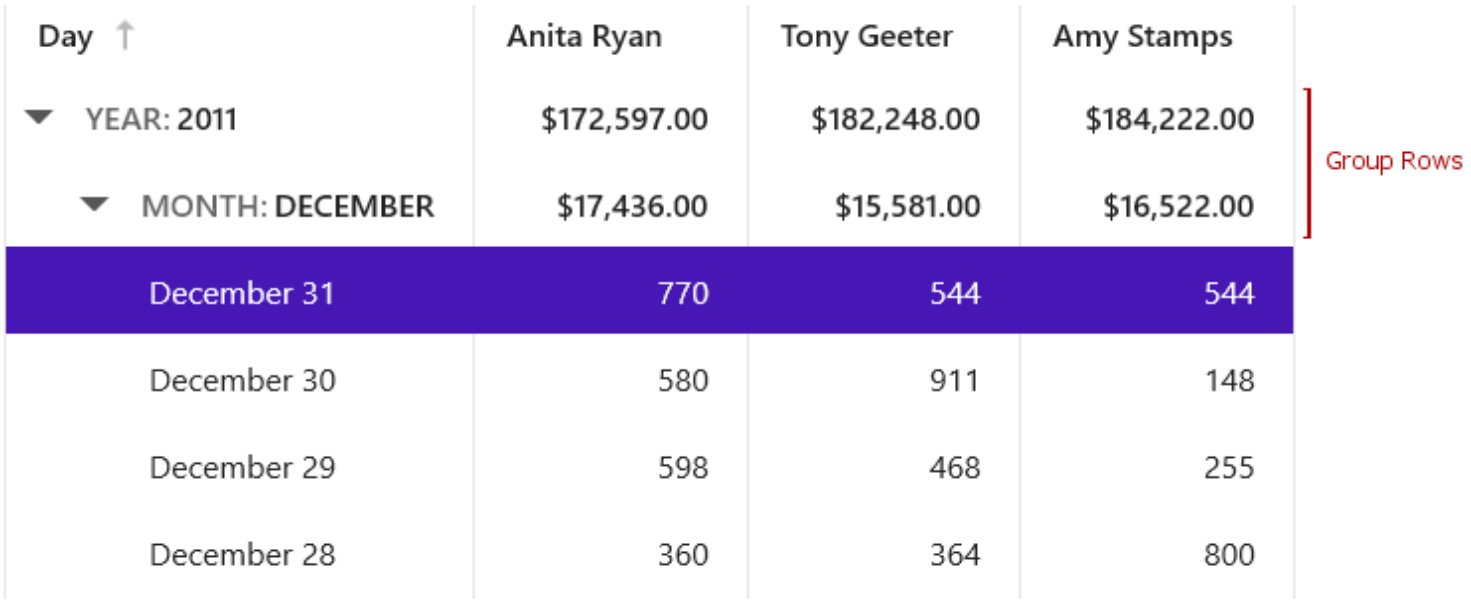
Characteristics	Members
Visibility	GridControlBase.ShowGroupPanel

© 2018 Developer Express Inc.

Group Row

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Group Row

Group rows are used to organize data rows into a tree when data grouping is applied.



The table below lists the main properties affecting element behavior and appearance.

Characteristics	Members
Expanding and Collapsing	GridControl.ExpandGroupRow, GridControl.CollapseGroupRow, GridControl.AutoExpandAllGroups

© 2018 Developer Express Inc.

New Item Row

Windows 10 App Controls > Controls > Data Grid > Visual Elements > New Item Row

The **New Item Row** allows end-users to add new records. It can be displayed above or below all data and group rows.

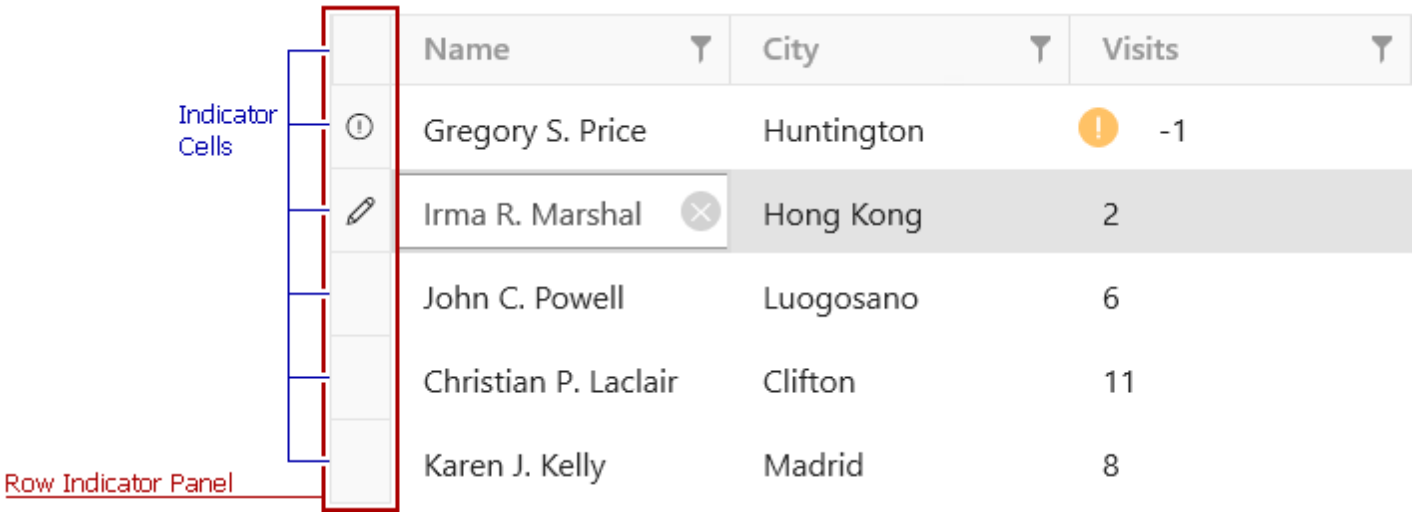
The table below lists the main properties affecting element behavior and appearance.

Characteristics	Members
Visibility and Position	GridControl.NewItemRowPosition
Behavior	GridControl.InitNewRow

© 2018 Developer Express Inc.

Row Indicator Panel

The **Row Indicator Panel** represents a region displayed at the left edge of a grid. The panel contains row indicator cells corresponding to different grid sections (a column header panel, data rows, etc.). The cell related to the focused row indicates the row state (whether it is in edit mode, has been modified, etc.).



The table below lists the main properties affecting element behavior and appearance.

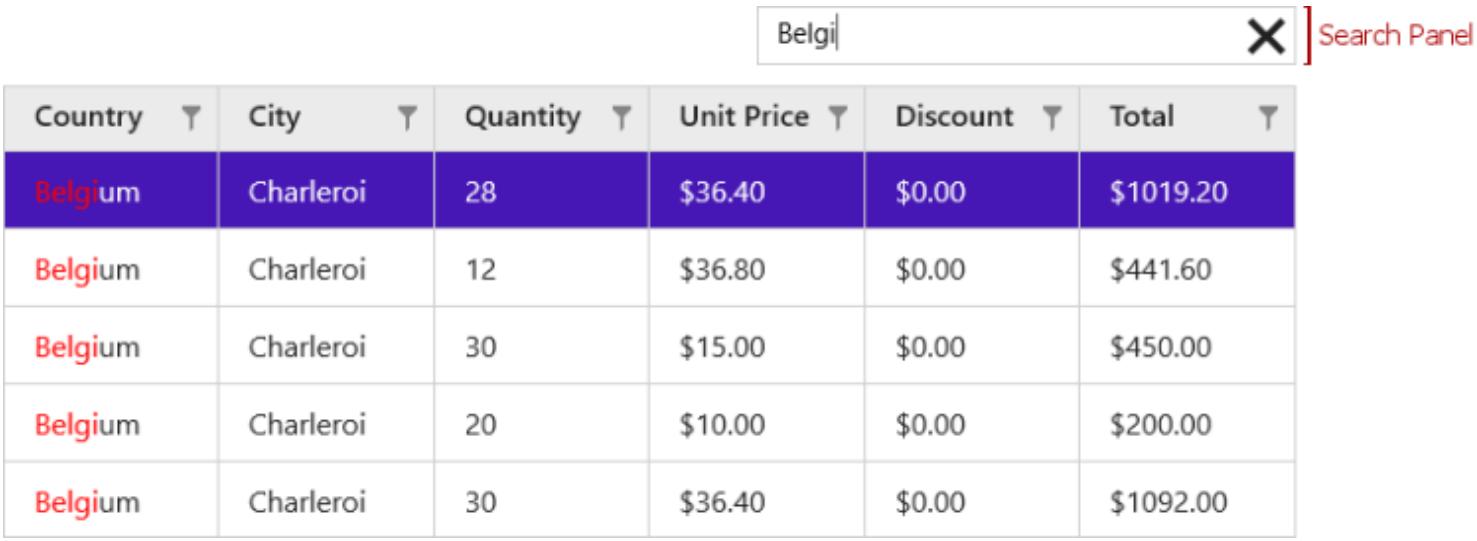
Characteristics	Members
Visibility	GridControl.ShowIndicator
Width	GridControl.IndicatorWidth
Horizontal Offset	GridControl.RowIndicatorHorizontalOffset

© 2018 Developer Express Inc.

Search Panel

Windows 10 App Controls > Controls > Data Grid > Visual Elements > Search Panel

The built-in **Search Panel** provides an easy way to search against multiple columns. This panel is displayed within the Group Panel. If the Group Panel is hidden, the **Search Panel** is shown above the Column Header Panel.



The table below lists the main properties affecting element behavior and appearance.

Characteristics	Members
Visibility	DataControlBase.ShowSearchPanelMode - Specifies when the Search Panel is displayed. By default, an end-user can show and hide the Search Panel when required. To display the Search Panel, an end-user should press **CTRL**+**F**. To hide the Search Panel, press the **ESC** key (the first press clears the search box; the second press closes the Search Panel).
Searching	DataControlBase.SearchPanelFindMode - Specifies whether a search starts automatically, or must be started manually by pressing **ENTER**. DataControlBase.SearchDelay - Specifies the wait time, in milliseconds, before a data search is initiated (in an automatic search mode). DataControlBase.SearchPanelCriteriaOperatorType - Specifies the logical operator type (**AND** or **OR**). Without quotation marks, words separated by the space character are treated as individual conditions. DataControlBase.SearchPanelFindFilter - Specifies the type of the comparison operator used to create filter conditions.
Search String	Searches are performed against a string specified by an end-user in a Search Panel's edit box. To specify a search string in code, use the DataControlBase.SearchString property.
Search Columns	DataControlBase.SearchColumns. By default, this property is set to "*". In this instance, a search is performed against all visible columns. To search against specific columns, specify the corresponding field names, delimiting them with the ";" character. You can also use the

© 2018 Developer Express Inc.

	ColumnBase.AllowSearchPanel property to specify whether the column data is taken into account when using the search panel.
Search Results	DataControlBase.SearchPanelHighlightResults - Specifies whether or not the search strings within the matched records should be highlighted.
Filtering	DataControlBase.SearchPanelAllowFilter - Specifies whether or not the grid displays only those records that match the search criteria.

Search Syntax

In its simplest form, a search criterion consists of a single word. To search for a string containing a space character, specify this string in quotation marks. Without quotation marks, words separated by the space character are treated as individual conditions (using the logical **OR** operator by default). To specify the logical operator, use the DataControlBase.SearchPanelCriteriaOperatorType property.

To search against a specific column, precede a search string with the column's display name plus a colon character.

ColumnDisplayCaption:SearchString

The DataControlBase.SearchPanelCriteriaOperatorType is not in effect when searching against specific columns. If the search criterion contains conditions for which search columns are specified, the AND logical operator is used.

Precede a condition with "+" to select records that match this condition. Other records will be excluded from the result. The "+" specifier allows you to implement the logical **AND** operator.

Precede a condition with "-" to exclude records that match this condition from the result set.

Examples:

Search Criteria	Description
`register`	Selects records that contain the "register" string in any search column.
`check register Dave`	Selects records that contain the "check" or "register" or "Dave" strings in any search column.
`"check register"`	Selects records that contain "check register" in any search column.
`screen +"Richard Fisher"`	Selects records that contain both "screen" and "Richard Fisher" in search columns.
`data +entry -mark`	Selects records that contain both "data" and "entry" in search columns, excluding records that contain "mark".
`menu mask -file`	Selects records that contain "menu" or "mask", excluding records that contain "file".
`From:Roller +Subj:"currency mask"`	Selects records that contain "Roller" in the column that starts with "From", and also contain "currency mask" in the column that starts with "Subj".
`import -From:Steve`	Selects records that contain "import" in any search column, excluding records that contain "Steve" in the column that starts with "From".

Note

Searches performed using the **Search Panel** are case insensitive.

© 2018 Developer Express Inc.

Filter Panel

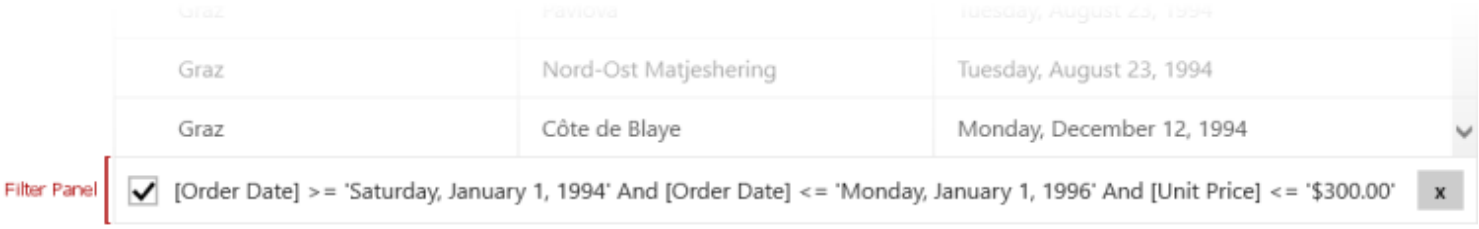
The **Filter Panel** displays a string representation of the filter criteria applied to the grid. It displays the following elements.

- **Filter Expression**
  Column filters are combined by the AND operator in a single filter expression, which is applied to a grid. The filter string is considered to be the WHERE clause of a SQL SELECT statement. To obtain the filter string applied to a grid, use the DataControlBase.FilterString property.
- **Clear Button**

Clears the current filter.

- **Enable Filter**

This check box can be used by an end-user to enable or temporarily disable the current filter. To do this in code, use the DataControlBase.IsFilterEnabled property.



The table below lists the main properties affecting element behavior and appearance.

Characteristics	Members
Visibility	DataControlBase.ShowFilterPanelMode
Contents	DataControlBase.FilterPanelText

Examples

Binding to Data

How to: Bind the Grid to ICollectionView

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4348.	

The example shows how to bind the Grid Control to the ICollectionView.

Use buttons to select an item in the collection. A checkbox specifies whether the grid's currently selected item is synchronized with the collection.

How to: Display Unbound Data

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4306.	

This example shows how to add an unbound column to the Grid Control.

C#

```
 (MainPage.xaml.cs)
using System;
using DevExpress.Data;
using Windows.UI.Xaml.Controls;
namespace Unbound_Columns
{
    public sealed partial class MainPage : Page
    {
        public MainPage()
        {
            this.InitializeComponent();
            grid.ItemsSource = new ProductList();
            grid.TotalSummary.Add(SummaryItemType.Count, "ProductName");
            grid.TotalSummary.Add(SummaryItemType.Max, "UnitPrice").DisplayFormat = "Max: {0:c2}";
            grid.TotalSummary.Add(SummaryItemType.Average, "UnitPrice").DisplayFormat = "Avg: {0:c2}";
        }
        private void grid_CustomUnboundColumnData(object sender, DevExpress.UI.Xaml.Grid.GridColumnDataEve
            if (e.IsGetData) {
                int price = Convert.ToInt32(e.GetListSourceFieldValue("UnitPrice"));
                int quantity = Convert.ToInt32(e.GetListSourceFieldValue("Quantity"));
                e.Value = price * quantity;
            }
        }
    }
}
```

Calculating Summaries

How to: Summarize Empty Cells

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4333.

The following example demonstrates how to use custom summaries to count the total number of empty cells in a certain grid column.

C#

```
 (MainPage.xaml.cs)
using System.Collections.Generic;
using DevExpress.Data;
using DevExpress.UI.Xaml.Grid;
using Windows.UI.Xaml.Controls;
namespace CustomSummary {
    public sealed partial class MainPage : Page {
        List<TestData> list;
        Dictionary<int, bool> selectedValues = new Dictionary<int, bool>();
        public MainPage() {
            this.InitializeComponent();
            list = new List<TestData>();
            for (int i = 0; i < 100; i++) {
                list.Add(new TestData() { Text = "item " + i, Number = i });
                if (i % 3 == 0)
                    list[i].Number = null;
            }
            grid.ItemsSource = list;
        }
        int emptyCellsTotalCount = 0;
        public class TestData {
            public string Text { get; set; }
            public int? Number { get; set; }
        }
        private void grid_CustomSummary(object sender, DevExpress.Data.CustomSummaryEventArgs e) {
            if (((GridSummaryItem)e.Item).FieldName != "Number")
                return;
            if (e.IsTotalSummary) {
                if (e.SummaryProcess == CustomSummaryProcess.Start) {
                    emptyCellsTotalCount = 0;
                }
                if (e.SummaryProcess == CustomSummaryProcess.Calculate) {
                    int? val = (int?)e.FieldValue;
                    if (!val.HasValue)
                        emptyCellsTotalCount++;
                    e.TotalValue = emptyCellsTotalCount;

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4881.	

This example shows how to group rows using custom rules. When grouping by the 'Unit Price' column, the rows in this column that have values between 0 and 10 should be combined into a single group. Rows whose values fall between 10 and 20 should be combined into another group, etc.

C#

```
 (MainPage.xaml.cs)
using System;
using System.Collections.Generic;
using Windows.UI.Xaml.Controls;
namespace HowToCustomGrouping
{
    public sealed partial class MainPage : Page
    {
        public MainPage()
        {
            this.InitializeComponent();
            grid.ItemsSource = new ProductList();
            grid.Columns["UnitPrice"].GroupIndex = 0;
        }
        private void GridControl_CustomColumnGroup(object sender, DevExpress.UI.Xaml.Grid.CustomColumnSort

How to: Implement Custom Sorting

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4340.

This example demonstrates how to implement custom sorting in the Grid Control. To do this, handle the GridControl.CustomColumnSort event, assign your custom sorted list to the e.Result property and set the e.Handled property to True.

C#

```
 (MainPage.xaml.cs)
using System.Collections.Generic;
using System.Collections.ObjectModel;
using DevExpress.XtraGrid;
using Windows.UI.Xaml;
using Windows.UI.Xaml.Controls;
namespace CustomSorting {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            grid.ItemsSource = new MonthList();
            grid.SortBy(grid.Columns[0]);
        }
        private void CheckBox_Checked(object sender, RoutedEventArgs e) {
            grid.Columns[0].SortMode = ColumnSortMode.Custom;
        }
        private void CheckBox_Unchecked(object sender, RoutedEventArgs e) {
            grid.Columns[0].SortMode = ColumnSortMode.Default;
        }
        private void grid_CustomColumnSort(object sender, DevExpress.UI.Xaml.Grid.CustomColumnSortEventArg
            e.Result = Comparer<int>.Default.Compare(e.ListSourceRowIndex1, e.ListSourceRowIndex2);
            e.Handled = true;
        }
    }
    public class Month {
        public string month { get; set; }
    }
    public class MonthList : ObservableCollection<Month> {
        public MonthList()
            : base() {
            Add(new Month() { month = "January" });
            Add(new Month() { month = "February" });
            Add(new Month() { month = "March" });
            Add(new Month() { month = "April" });
            Add(new Month() { month = "May" });
            Add(new Month() { month = "June" });
            Add(new Month() { month = "July" });
            Add(new Month() { month = "August" });
            Add(new Month() { month = "September" });
            Add(new Month() { month = "October" });
            Add(new Month() { month = "November" });
            Add(new Month() { month = "December" });
        }
    }
}

Overview

This suite contains three chart controls - the CartesianChart control, the PieChart control and the FunnelChart control.

Cartesian Chart

The Cartesian Chart control is intended to plot a 2D series on an XY-Diagram and provides the following features.

- Bar view types: Side-by-side Bar, Stacked Bar, Full-Stacked Bar, Side-by-side Stacked Bar, Side-by-side Full-Stacked Bar
- Point and Line view types: Point, Line, Scatter Line, Step Line, Stacked Line, Full-Stacked Line
- Area view types: Area, Stacked Area, Full-Stacked Area, Step Area
- Automatic selection of data scale type based on bound data
- Scrolling & Zooming
- Built-in animation
- Built-in tooltips
- Strips
- Element selection
- Movable legend

Pie Chart

The Pie Chart control is intended to display Pie and Donut series and provides the following features.

- Supported view types: Pie, Donut, Nested Donut
- Automatic selection of data scale type based on bound data
- Built-in animation
- Built-in tooltips
- Element selection
- Table-like layout
- Movable legend

Funnel Chart

The Funnel Chart control is used to display Funnel series and provides the following features.

- Supported view type: Funnel
- Automatic selection of data scale type based on bound data
- Built-in animation
- Built-in tooltips
- Element selection
- Movable legend

Pie and Donut Views

Windows 10 App Controls > Controls > Charts > Charts Gallery > Pie and Donut Views

Topics in this section:

- Pie
- Donut
- Nested Donut

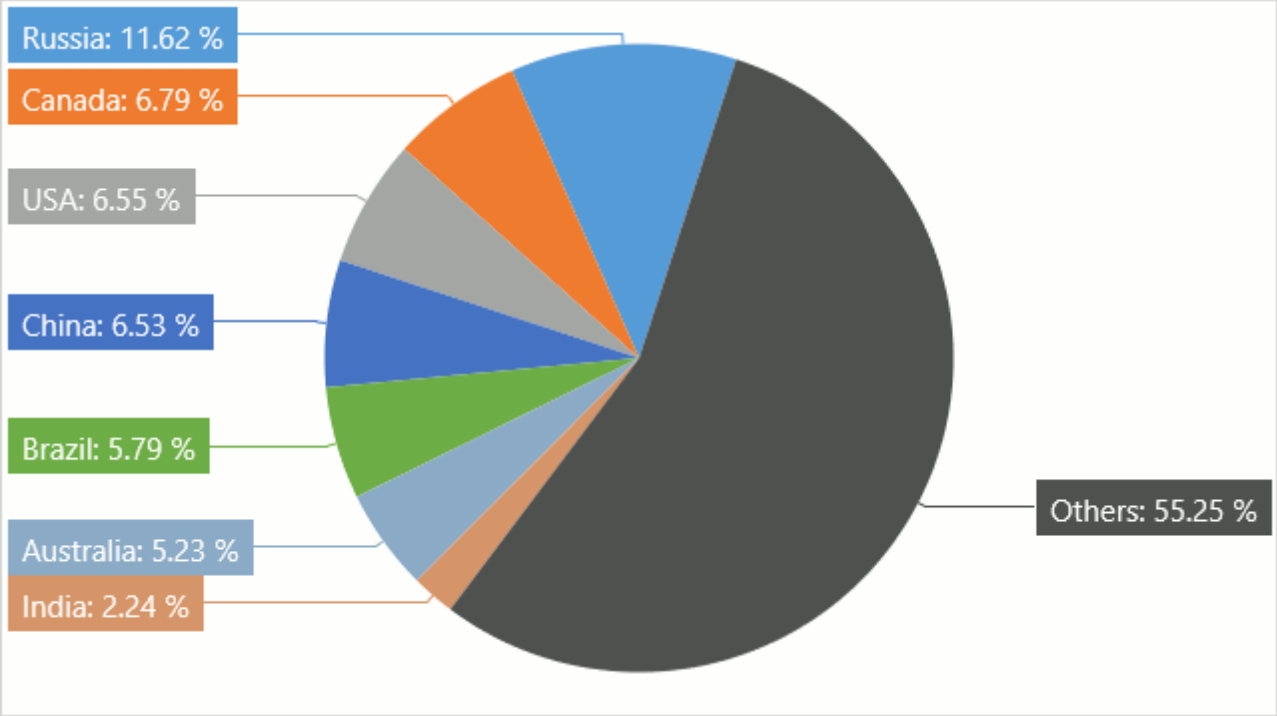
© 2018 Developer Express Inc.

Pie

Windows 10 App Controls > Controls > Charts > Charts Gallery > Pie and Donut Views > Pie

The **Pie** series is useful when it's necessary to compare the percentage values of different point arguments in the same series, and to illustrate these values as easy to understand pie slices.

An example of the **Pie** chart is shown in the image below.

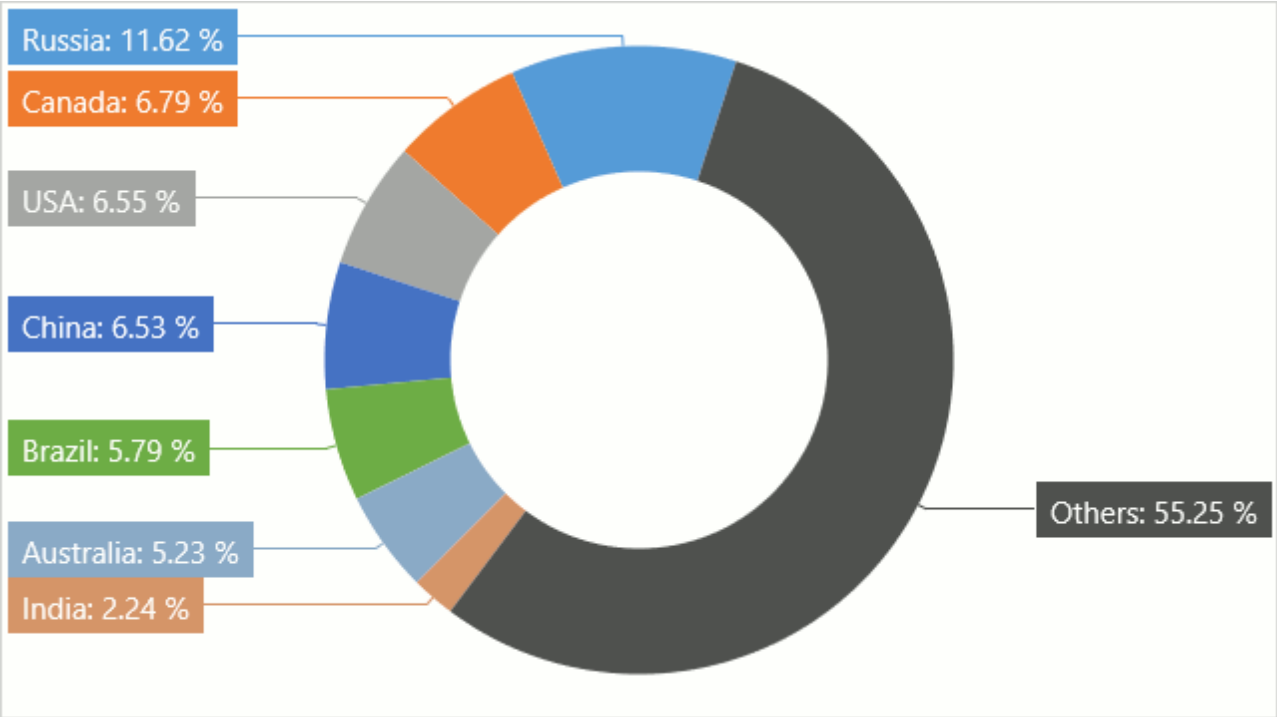


© 2018 Developer Express Inc.

Donut

The **Donut** series is similar to Pie, but has a hole in its center.

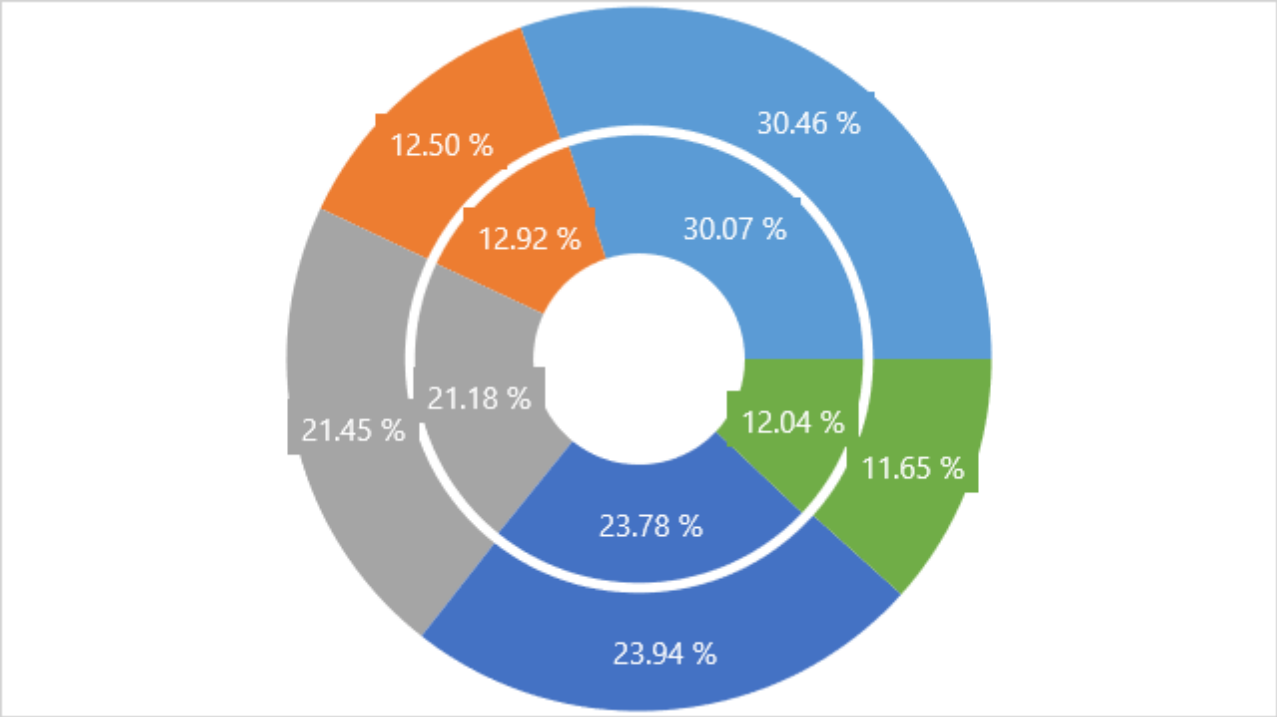
An example of the **Donut** charts is shown in the image below.



© 2018 Developer Express Inc.

Nested Donut

Nested Donuts are similar to the Donut series view, except that instead of comparing different donut series side by side, you can do so with one donut nested in another.



© 2018 Developer Express Inc.

Funnel View

Windows 10 App Controls > Controls > Charts > Charts Gallery > Funnel View

The **Funnel** series view is used to compare the percentage values of different point arguments in the same series and determine which point value(s) in the point series is (are) the most significant.

Typically, a **Funnel** series view displays a wide area at the top, indicating the total points' value, while other areas are proportionally smaller.

An example of the Funnel View chart is shown in the image below.

Bar and Column Views

Topics in this section:

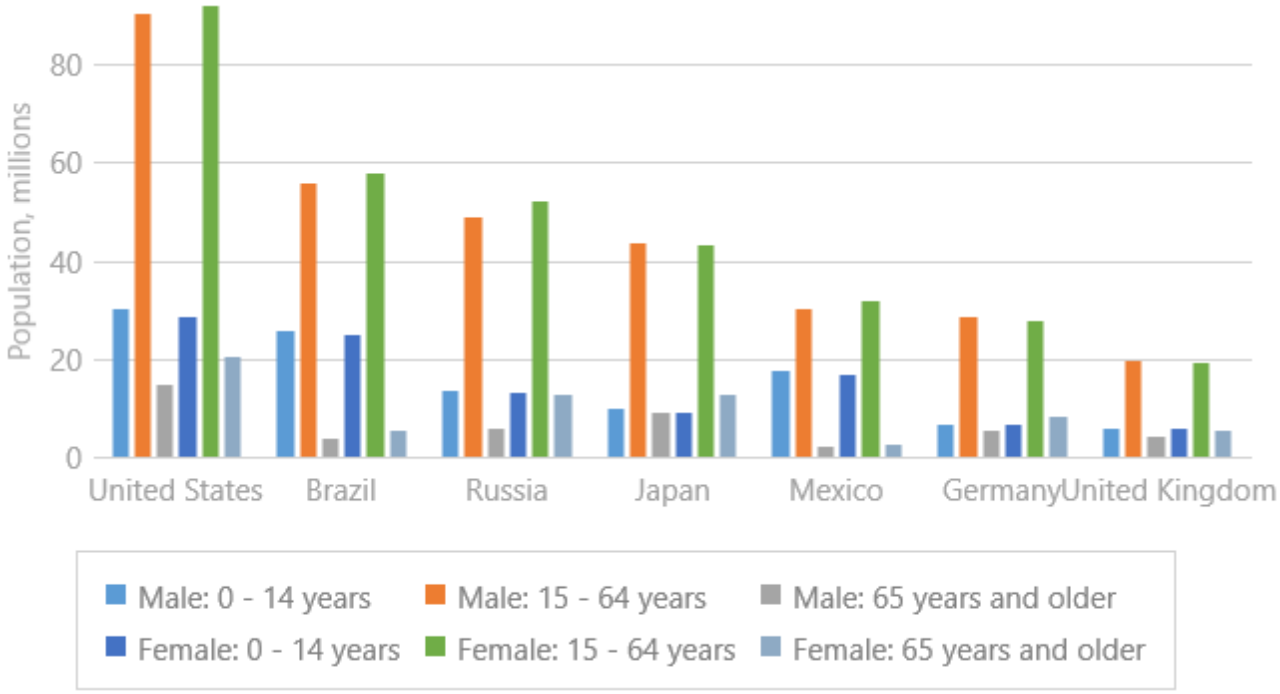
- Side-by-Side Bar
- Stacked Bar
- Full-Stacked Bar
- Side-by-Side Stacked Bar
- Side-by-Side Full-Stacked Bar

© 2018 Developer Express Inc.

Side-by-Side Bar

The **Side-by-Side Bar** series displays data points as individual bars, grouped by category, and the height of each bar is determined by the data point's value.

An example of the Side-by-Side Bar chart is shown in the image below.



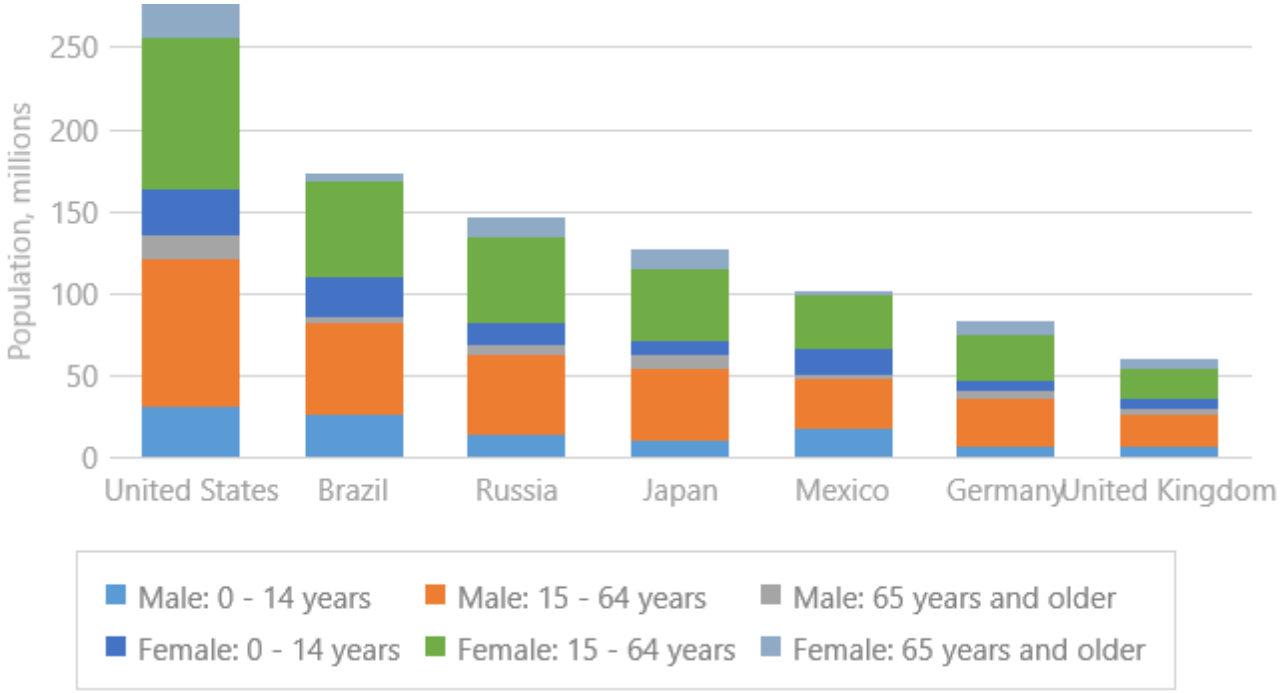
© 2018 Developer Express Inc.

Stacked Bar

Windows 10 App Controls > Controls > Charts > Charts Gallery > Bar and Column Views > Stacked Bar

The **Stacked Bar** series displays data as bars on a diagram, so that the value of each data point is aggregated with the underlying data points' values. This representation is useful when it's necessary to compare both the point values and their aggregate for the same point arguments.

An example of the Stacked Bar chart is shown in the image below.

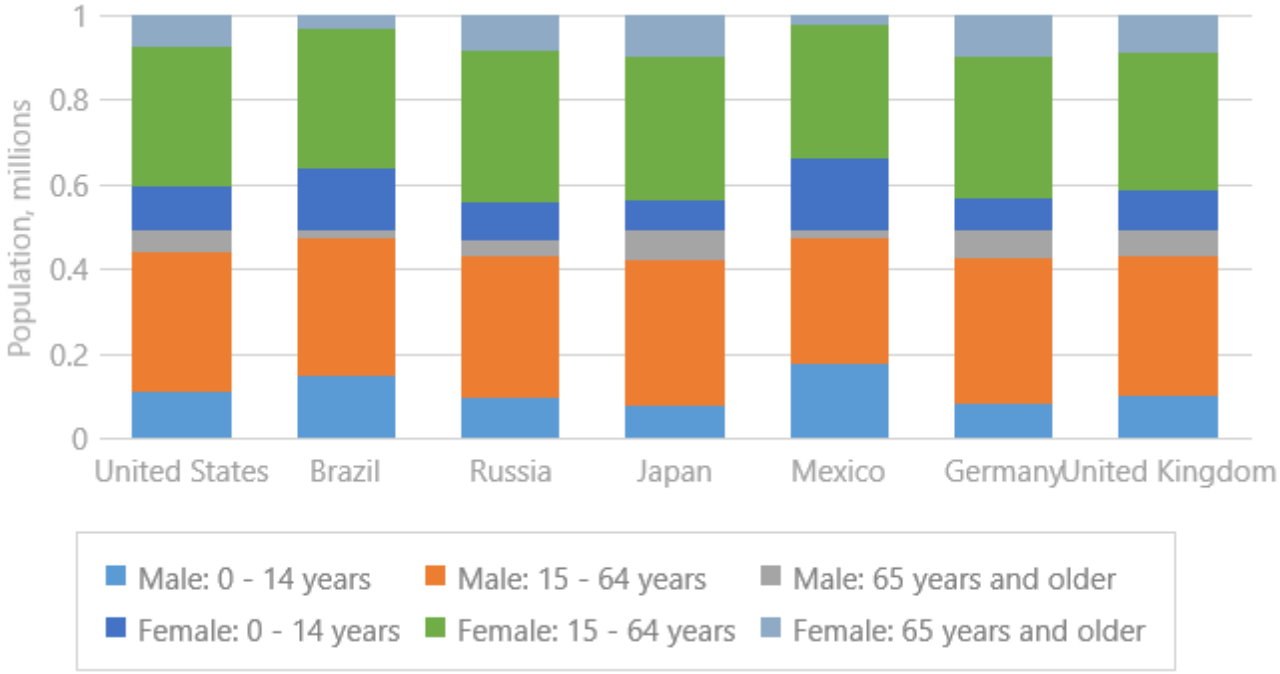


© 2018 Developer Express Inc.

Full-Stacked Bar

The **Full-Stacked Bar** series (100%-Stacked Bar series) displays all data points stacked, with a single bar for each category. The height of each bar is always the full height of the chart diagram (i.e. **1**). The series values are displayed as percentages of each bar.

An example of the Full-Stacked Bar chart is shown in the image below.



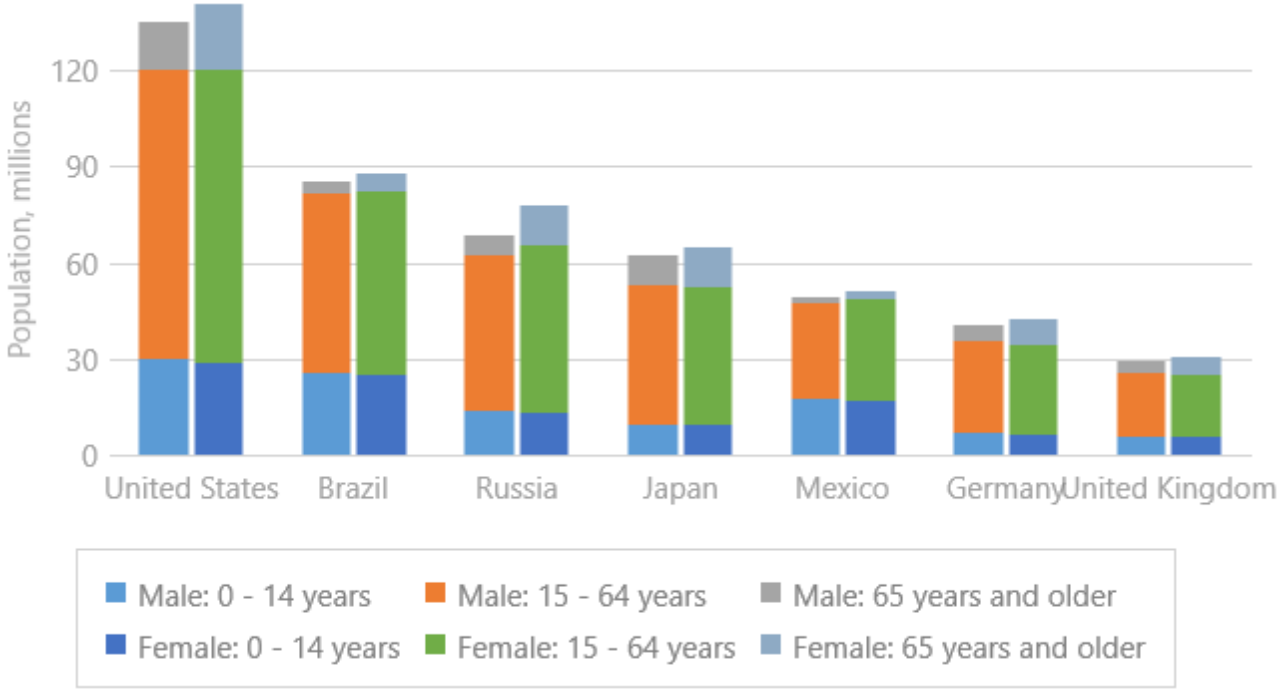
© 2018 Developer Express Inc.

Side-by-Side Stacked Bar

Windows 10 App Controls > Controls > Charts > Charts Gallery > Bar and Column Views > Side-by-Side Stacked Bar

The **Side-by-Side Stacked Bar** series combines the advantages of both the Stacked Bar and Side-by-Side Bar chart types, so that you can stack different bars, and combine them into groups shown side-by-side across the same axis value (via the SideBySideStackedBarSeriesView.StackedGroup property).

An example of the Side-by-Side Stacked Bar chart is shown in the image below.

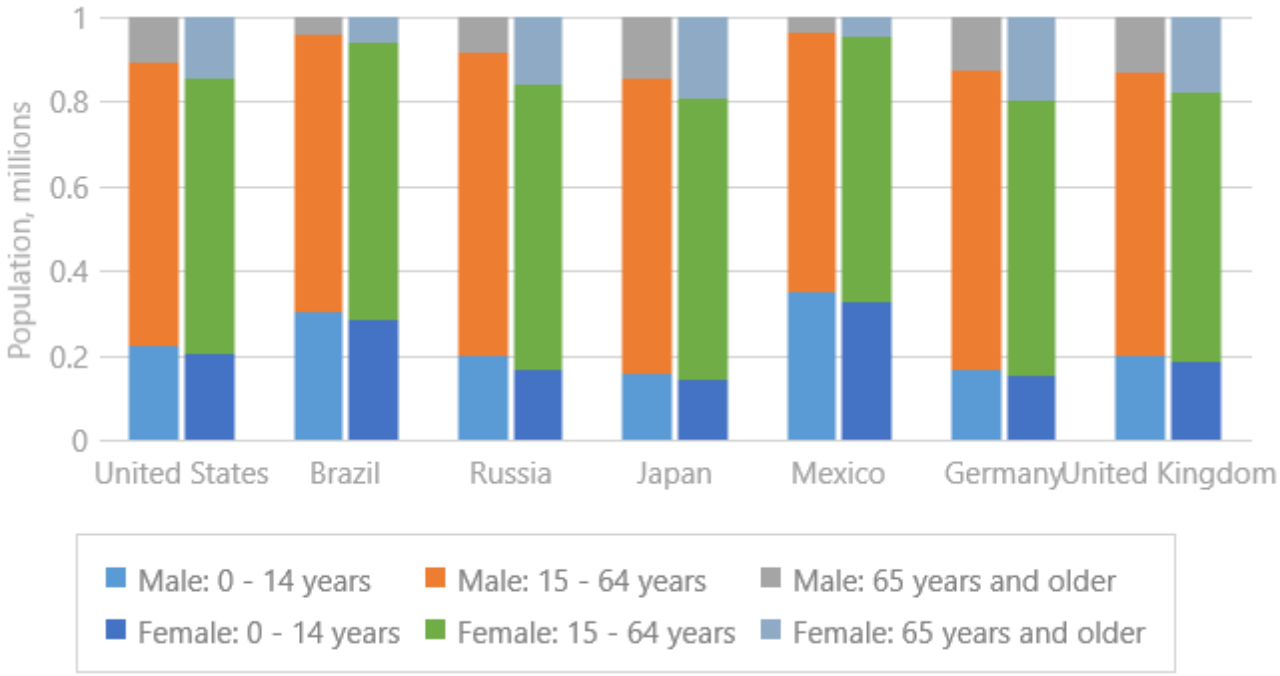


© 2018 Developer Express Inc.

Side-by-Side Full-Stacked Bar

The **Side-by-Side Full-Stacked Bar** series combines the advantages of both the Full-Stacked Bar and Side-by-Side Bar chart types, so that you can stack different bars, and combine them into groups shown side-by-side across the same axis value (via the SideBySideStackedBarSeriesView.StackedGroup property).

An example of the Side-by-Side Full-Stacked Bar chart is shown in the image below.



© 2018 Developer Express Inc.

Point and Line Views

Topics in this section:

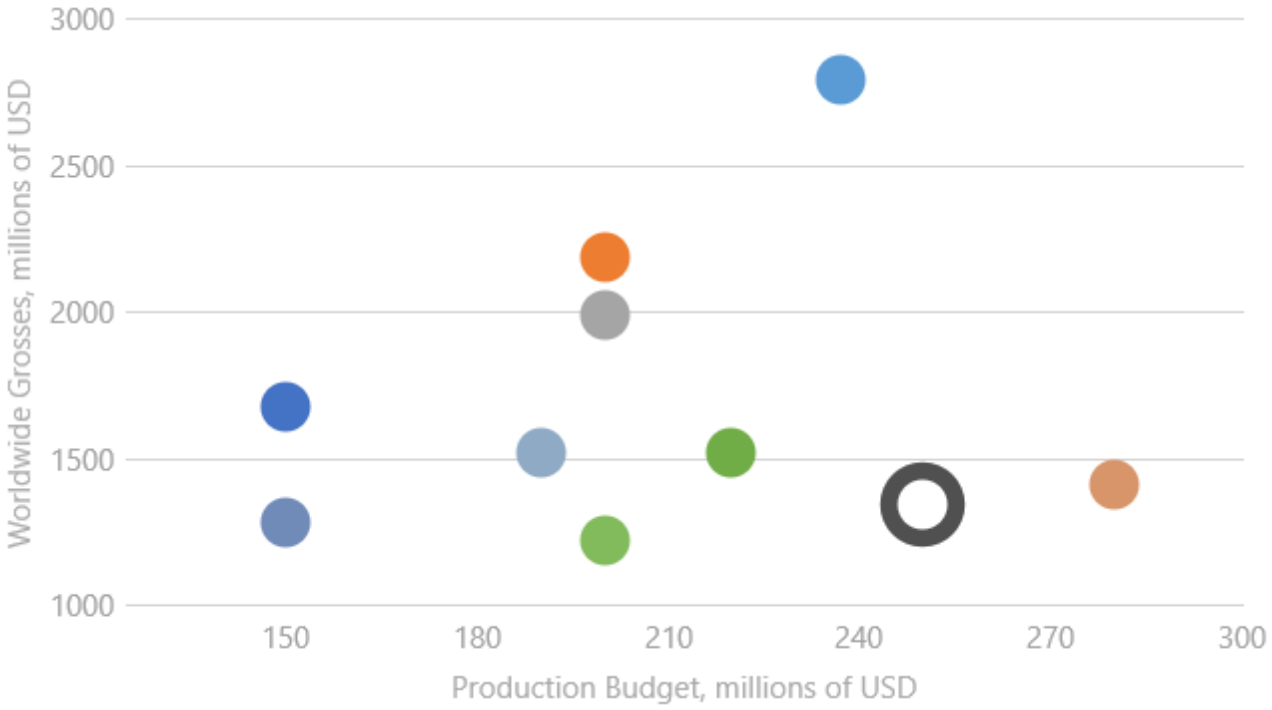
- Point
- Line
- Scatter Line
- Step Line
- Stacked Line
- Full-Stacked Line

© 2018 Developer Express Inc.

Point

The **Point** series is useful when it's necessary to show stand-alone data points on the same chart plot.

An example of the Point chart is shown in the image below.

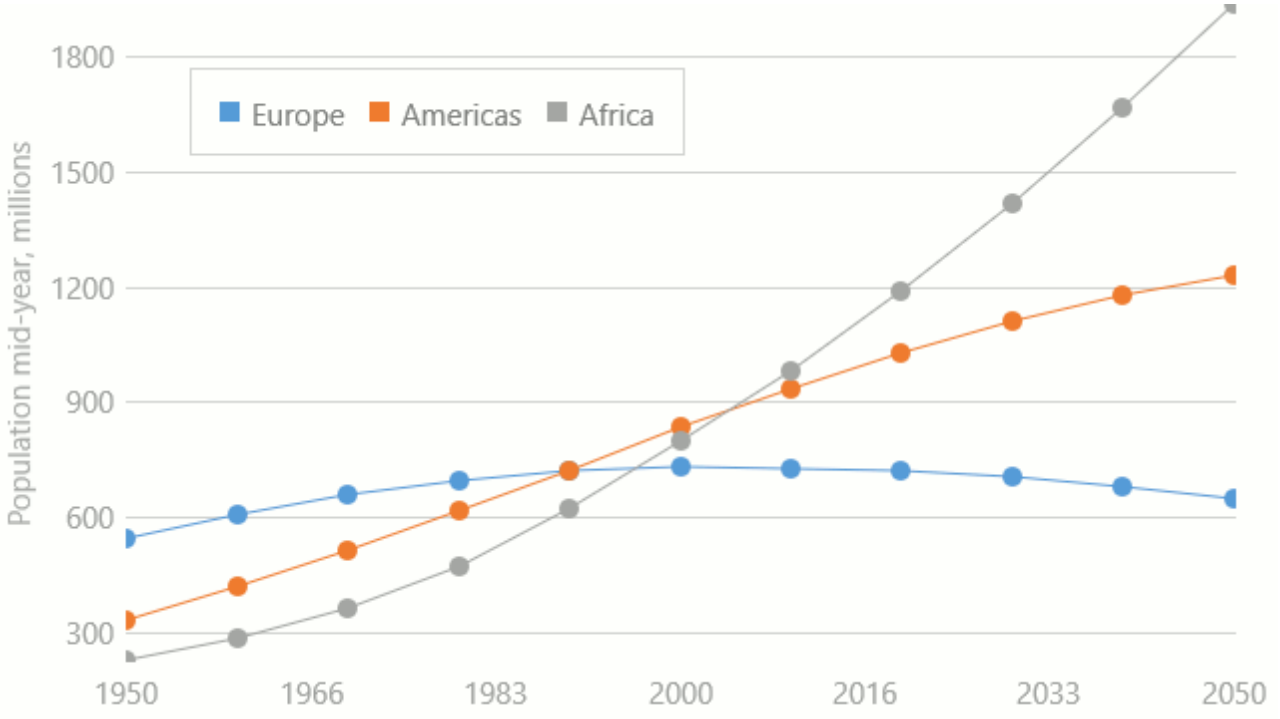


© 2018 Developer Express Inc.

Line

The **Line** series is useful when you need to show trends for one or several series on the same diagram, and to compare the values of several series for the same points arguments.

An example of the Line chart is shown in the image below.

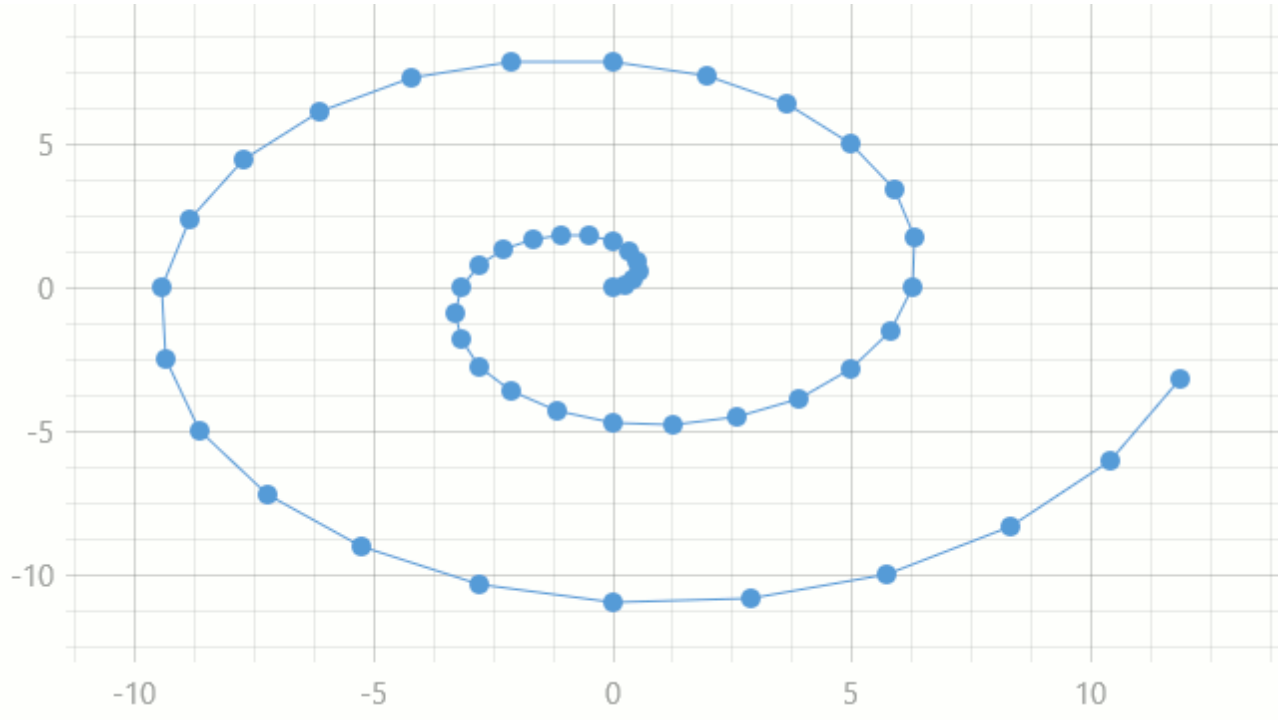


© 2018 Developer Express Inc.

Scatter Line

The **Scatter Line** series displays series points in the same order in which they are located in the collection (opposite to the Line series that automatically sorts all series points within the collection by their arguments). This chart type can be used in scientific work for displaying and comparing numeric values, such as scientific, statistical and engineering data.

An example of the Scatter Line chart is shown in the image below.

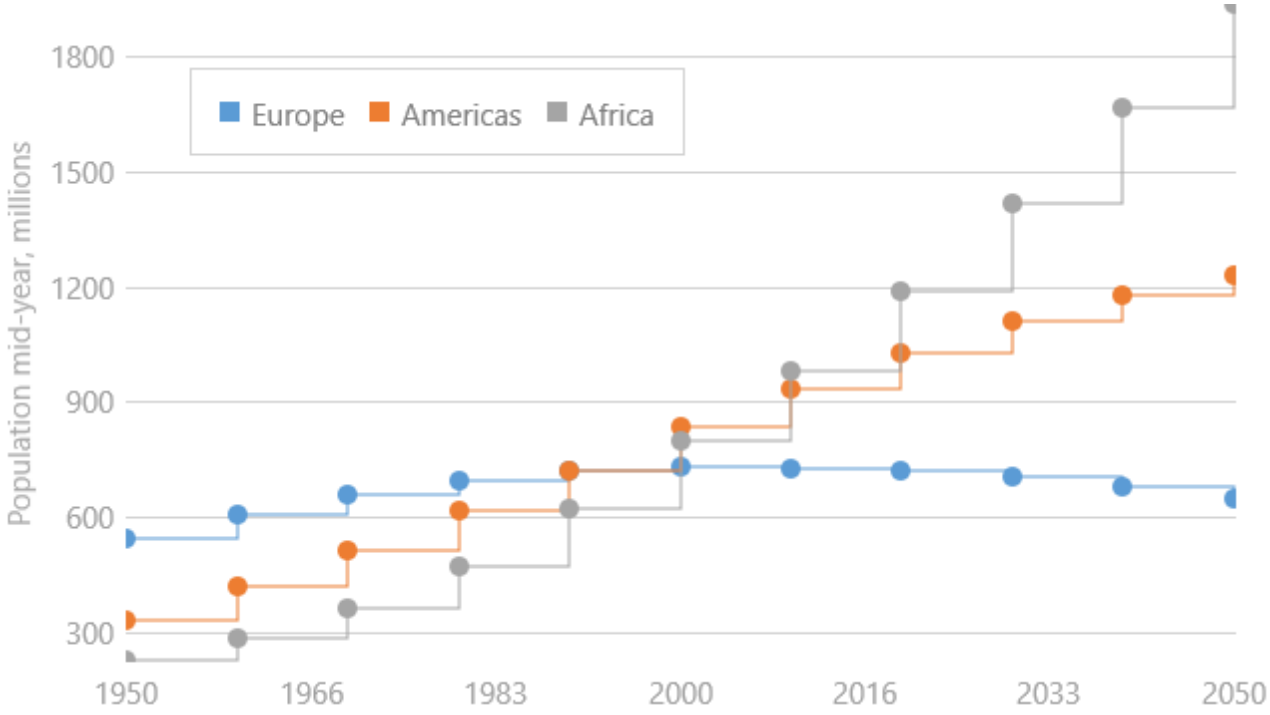


© 2018 Developer Express Inc.

Step Line

The **Step Line** series displays data as step lines on a diagram. This chart shows how much values have changed for different points of the same series.

An example of the Step Line chart is shown in the image below.

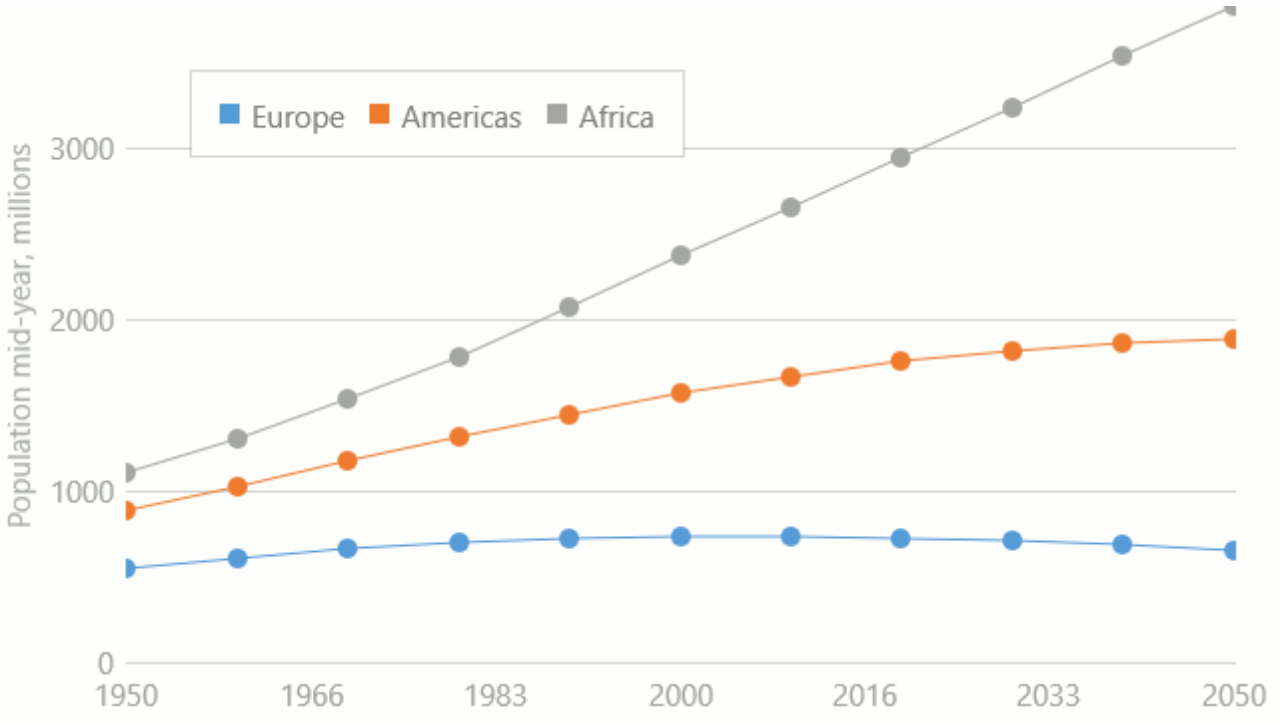


© 2018 Developer Express Inc.

Stacked Line

The **Stacked Line** series displays data as lines on a diagram, so that the value of each data point is aggregated with underlying data point values. This chart is useful when it is necessary to compare how much each series adds to the total aggregate value for specific arguments.

An example of the Stacked Line chart is shown in the image below.

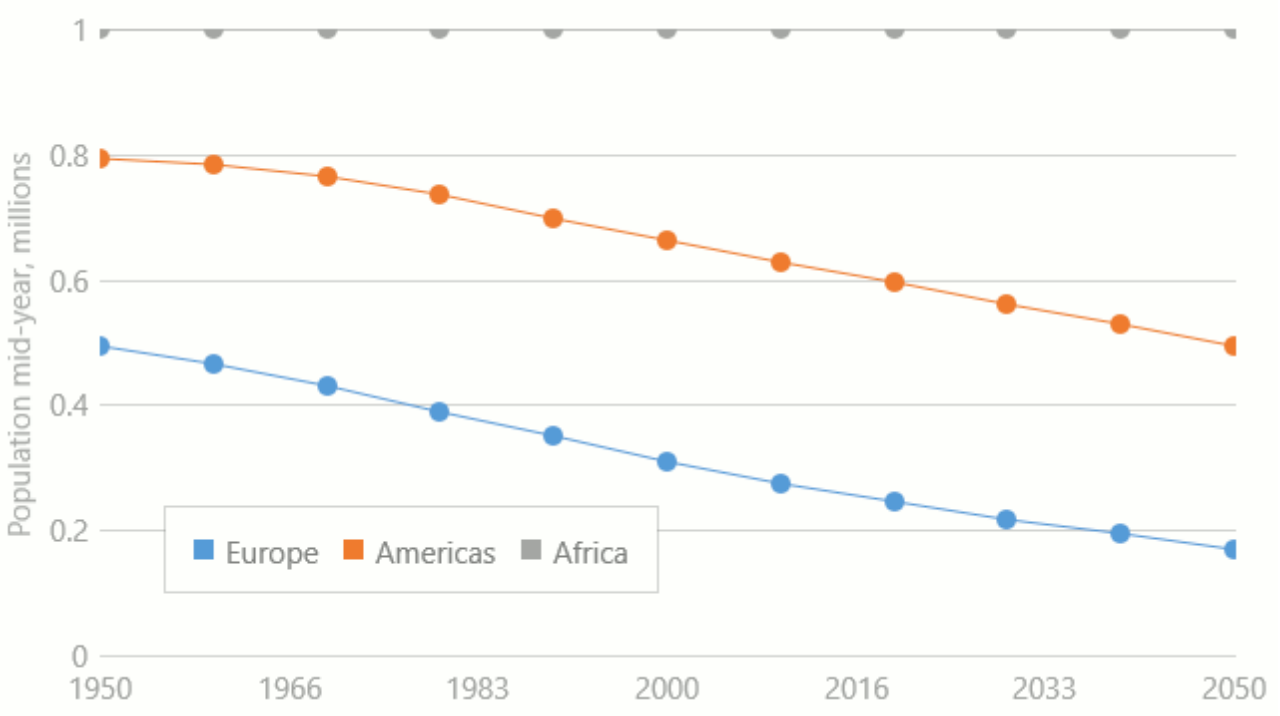


© 2018 Developer Express Inc.

Full-Stacked Line

The **Full-Stacked Line** series (100%-Stacked Line series) displays all data points stacked. This chart is useful when it is necessary to compare how much each series adds to the total aggregate value for specific arguments (as percents).

An example of the Full-Stacked Line chart is shown in the image below.



© 2018 Developer Express Inc.

Area Views

Windows 10 App Controls > Controls > Charts > Charts Gallery > Area Views

Topics in this section:

- Area
- Stacked Area
- Full-Stacked Area
- Step Area

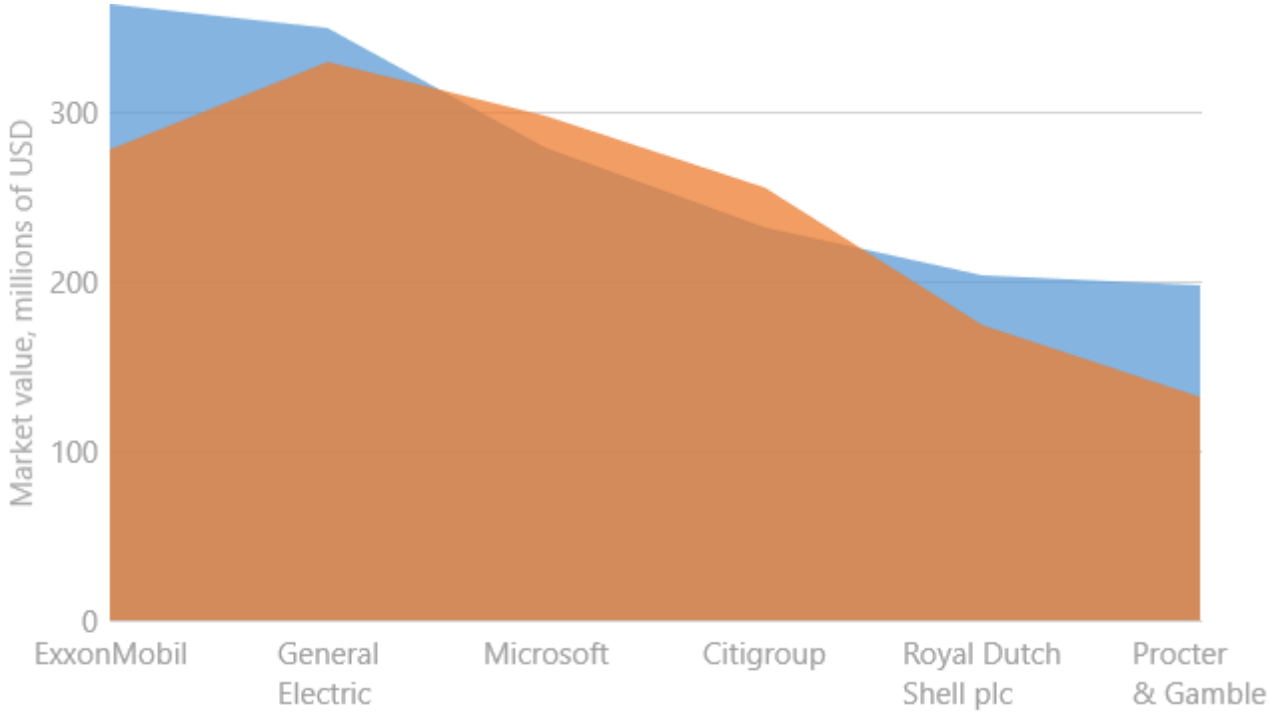
© 2018 Developer Express Inc.

Area

Windows 10 App Controls > Controls > Charts > Charts Gallery > Area Views > Area

The **Area** series displays data as filled areas on a diagram, with each data point displayed as a peak or hollow in the area. This representation is useful when you need to show trends for several series on the same diagram, and also show the relationship of the parts to the whole.

An example of the Area chart is shown in the image below.

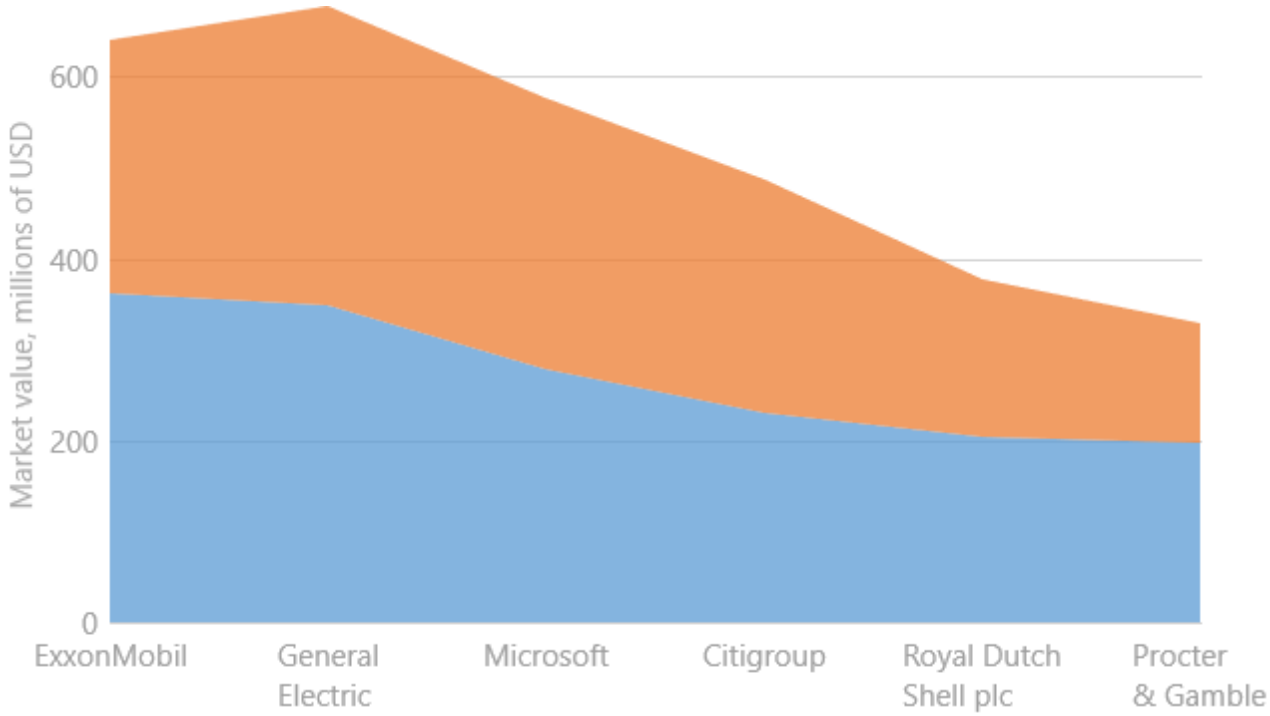


© 2018 Developer Express Inc.

Stacked Area

The **Stacked Area** series displays data as areas on a diagram, so that the value of each data point is aggregated with the underlying data points' values. This representation is useful when it is necessary to compare both the point values and their aggregate for the same point arguments.

An example of the Stacked Area chart is shown in the image below.

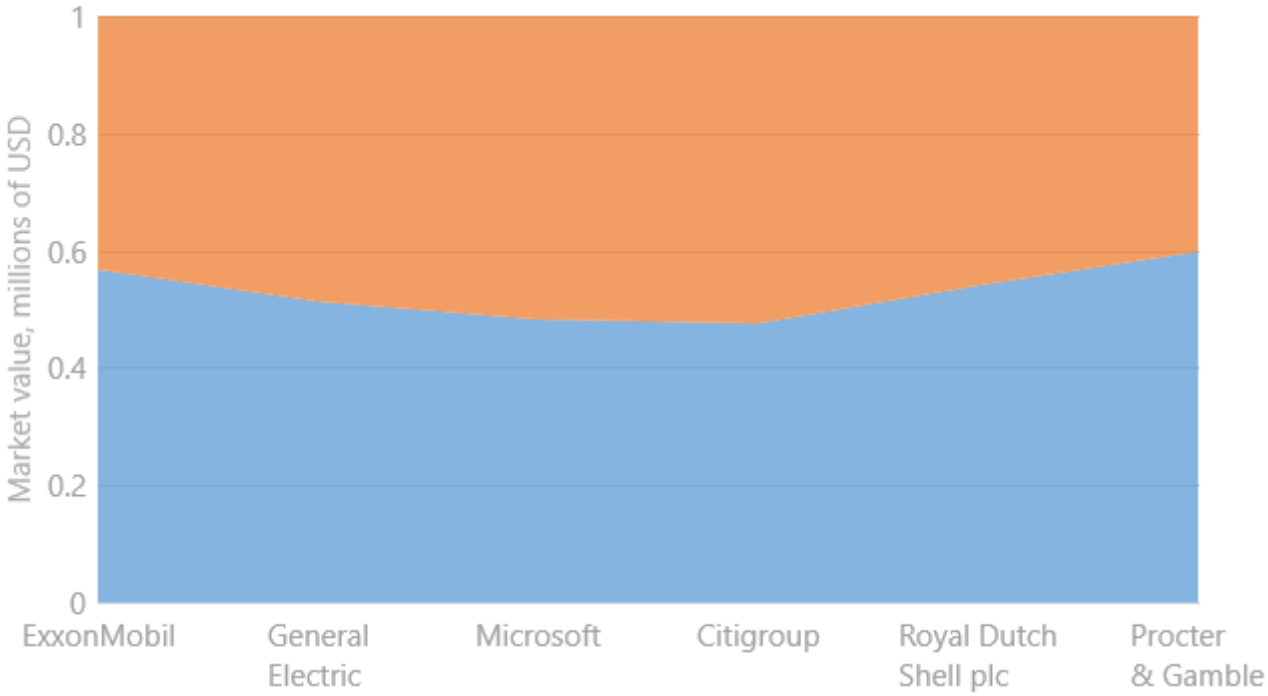


© 2018 Developer Express Inc.

Full-Stacked Area

The **Full-Stacked Area** series (100% Stacked Area series) displays data as areas on a diagram, so that the value of each data point is stacked with all the other corresponding data points' values. In this instance, the height of the area is always the full height of the chart diagram (i.e. **1**). This representation is useful for comparing the percentage values of several series for the same point arguments.

An example of the Full-Stacked Area chart is shown in the image below.



© 2018 Developer Express Inc.

Step Area

The **Step Area** series displays data as step areas on a diagram. This chart shows how much values have changed for different points of the same series.

An example of the Step Area chart is shown in the image below.

Getting Started

This section contains tutorials that are intended to help first-time users get acquainted with DevExpress Win10 App Charts. These examples demonstrate basic functionality of the control and provide you with step-by-step instructions on how to create simple charting applications with the help of the DevExpress Charts.

Topics in this section:

- Lesson 1 - Creating a Cartesian Chart
- Lesson 2 - Creating a Pie Chart
- Lesson 3 - Creating a Funnel Chart

© 2018 Developer Express Inc.

Lesson 1 - Creating a Cartesian Chart

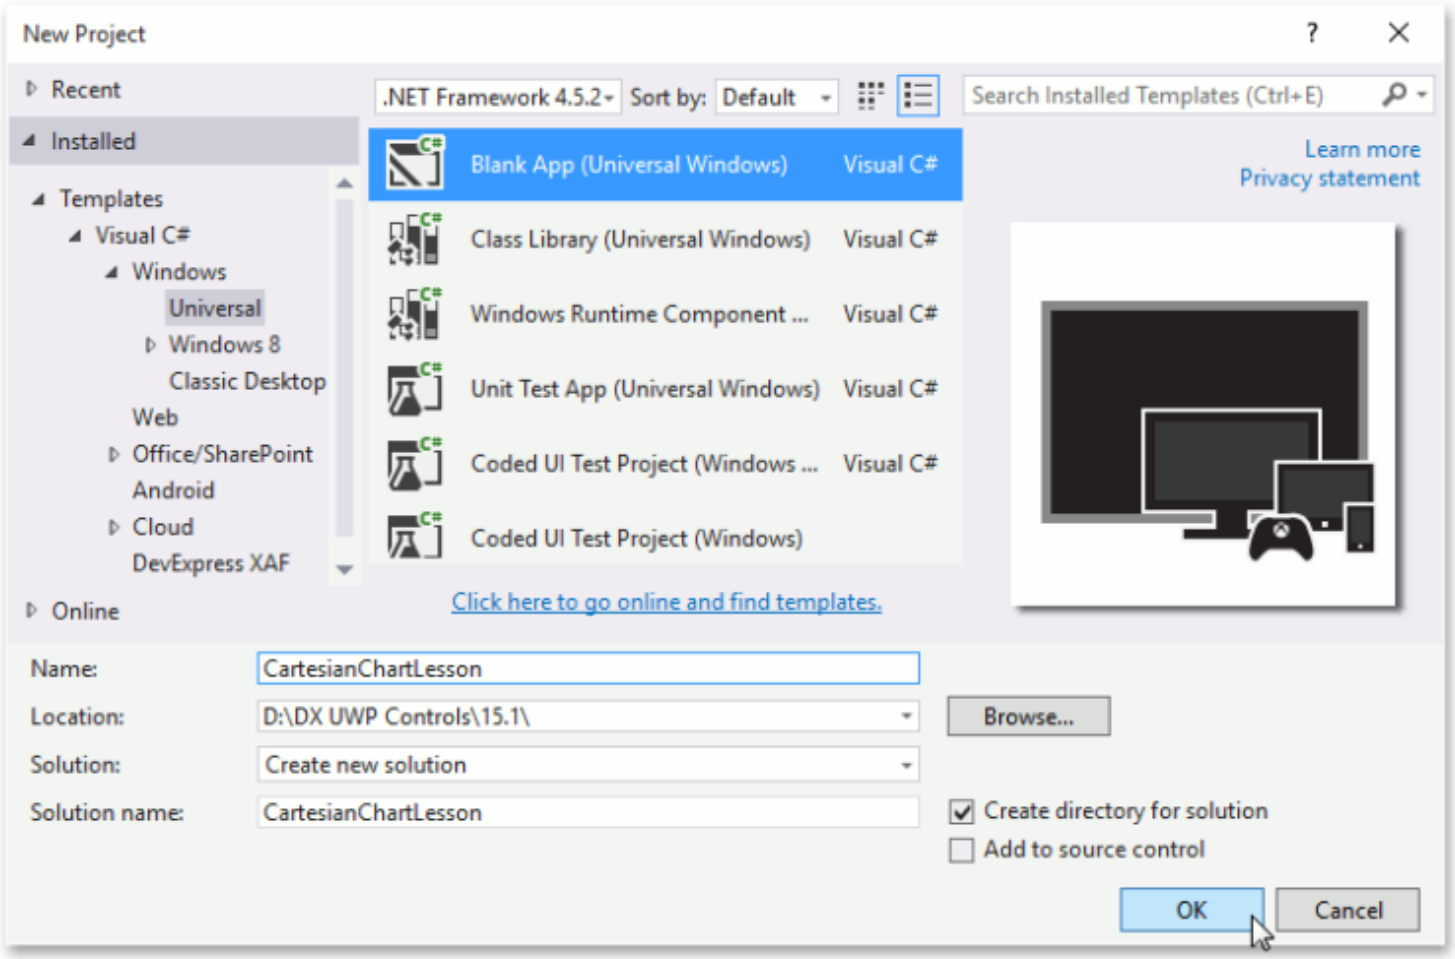
This lesson demonstrates how to create a simple Cartesian chart with three Stacked Bar series, populate them with data and adjust common settings.

To create a simple charting application, do the following.

- Step 1. Create a New Project and Add a Chart
- Step 2. Provide Chart Data
- Step 3. Customize a Chart
- Result

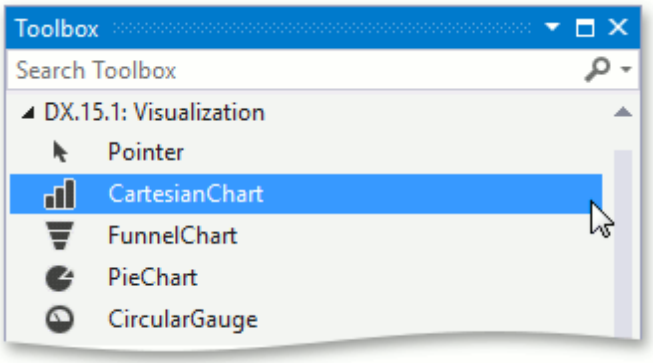
Step 1. Create a New Project and Add a Chart Control

- Run MS Visual Studio 2015 or 2017.
- Create a new **Universal | Blank App (Universal Windows)** project.



- Switch to the **MainPage.xaml** design view and add the CartesianChart control to the main page. To do this, drag and drop the **CartesianChart** item from the **DX.18.1: Visualization** toolbox tab.

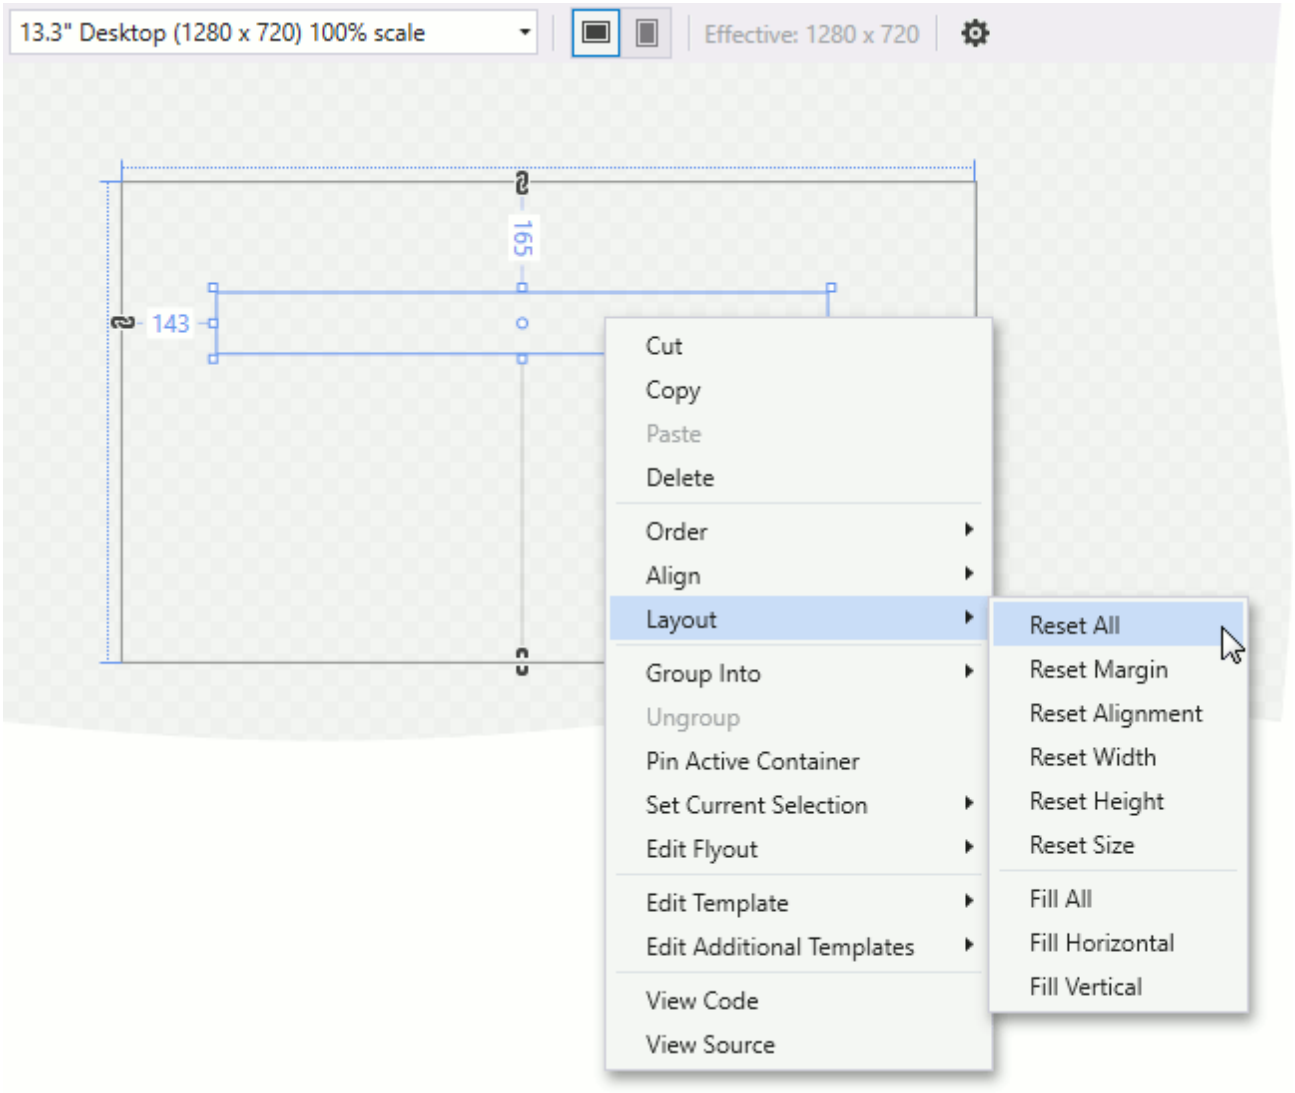
© 2018 Developer Express Inc.



Note

After that, the following SDK extensions will be added to the References list of your project: *DevExpress.Core* and *DevExpress.Visualization*.

- Right-click the **CartesianChart** object and choose the **Layout | Reset All** option in the context menu. This will stretch the chart to fill the whole window.



After this, your XAML may look like the following. If it doesn't, you can overwrite your code with:

Xaml

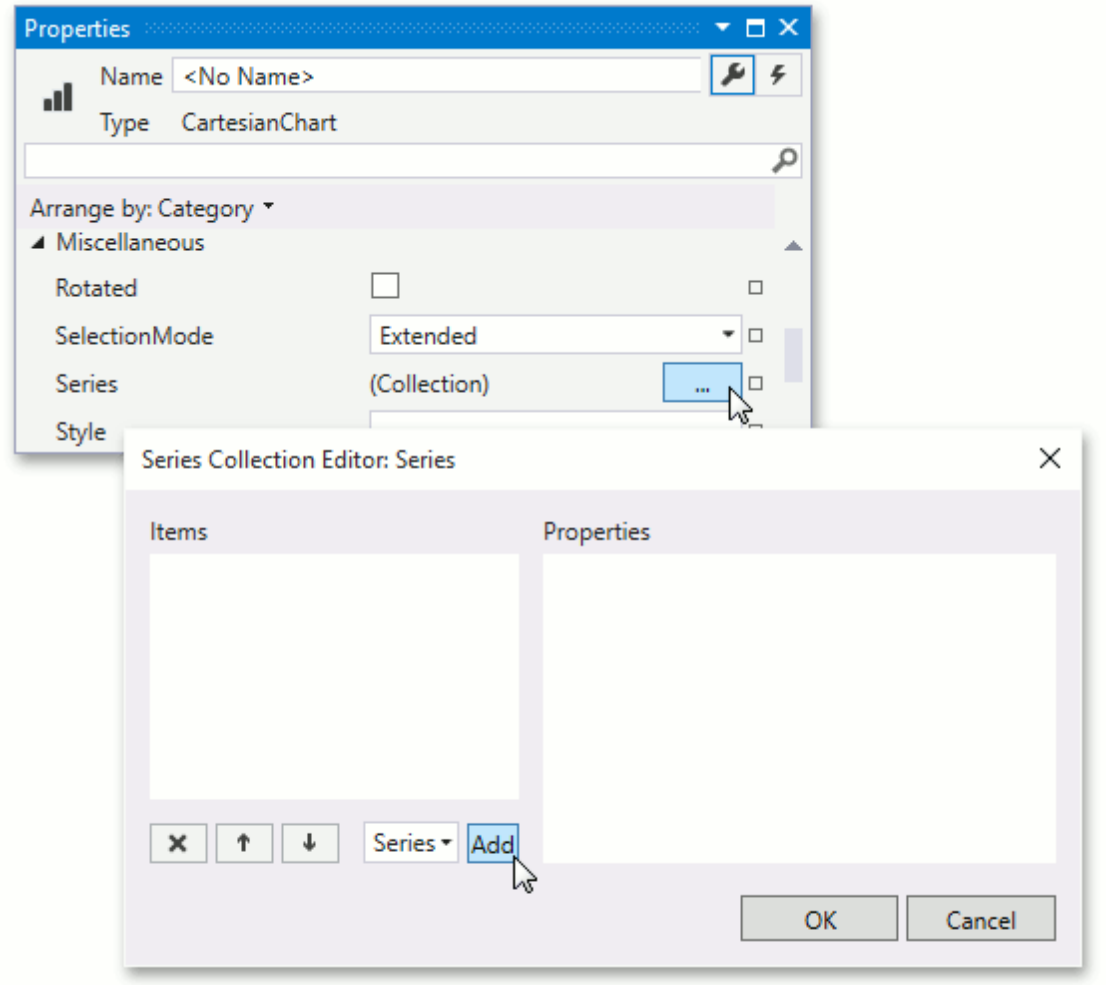
```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="CartesianChartLesson.MainPage">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Charts:CartesianChart/>
    </Grid>
</Page>
```

Let's proceed to the next step, and see how to add series to the chart and provide series points with data.

Step 2. Provide Chart Data

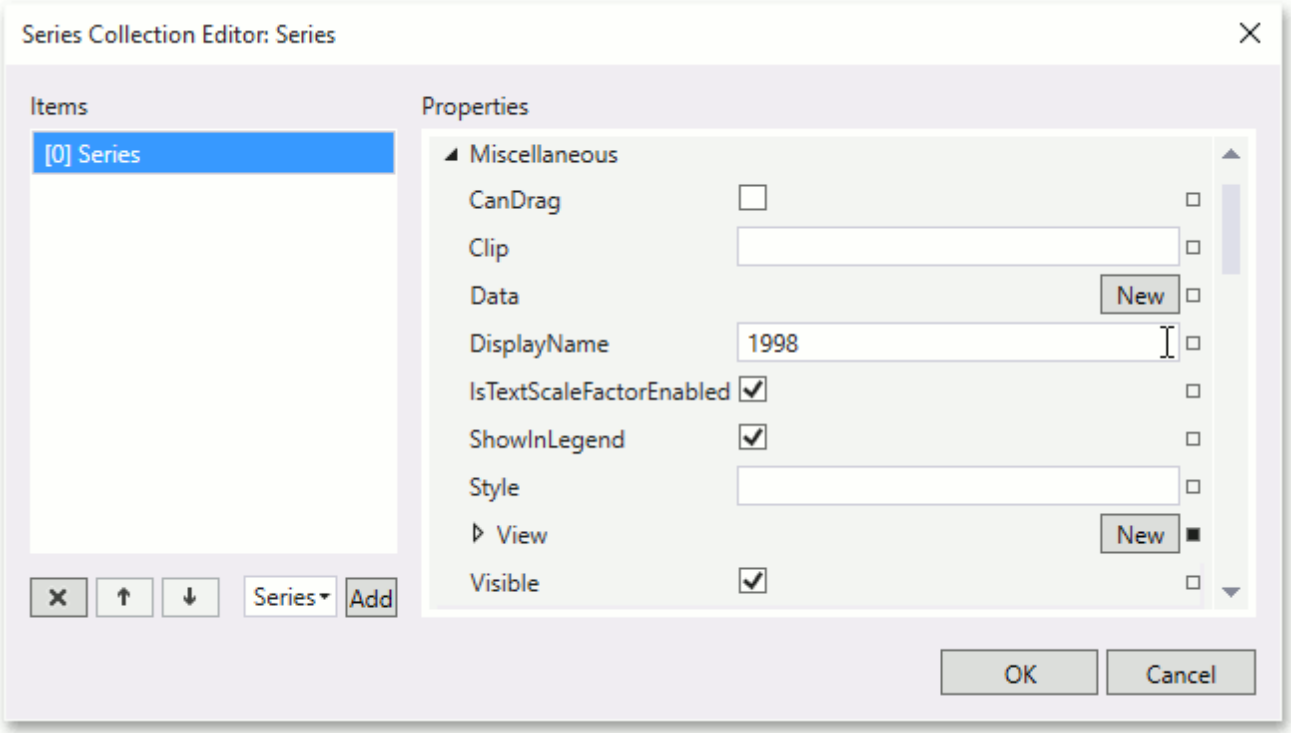
In this step, the chart will be manually populated with data.

- For the **CartesianChart** control, locate the ChartBase.Series property and click the ellipsis button to invoke the **Series Collection Editor: Series** dialog. In this dialog, add a Series object to the collection.

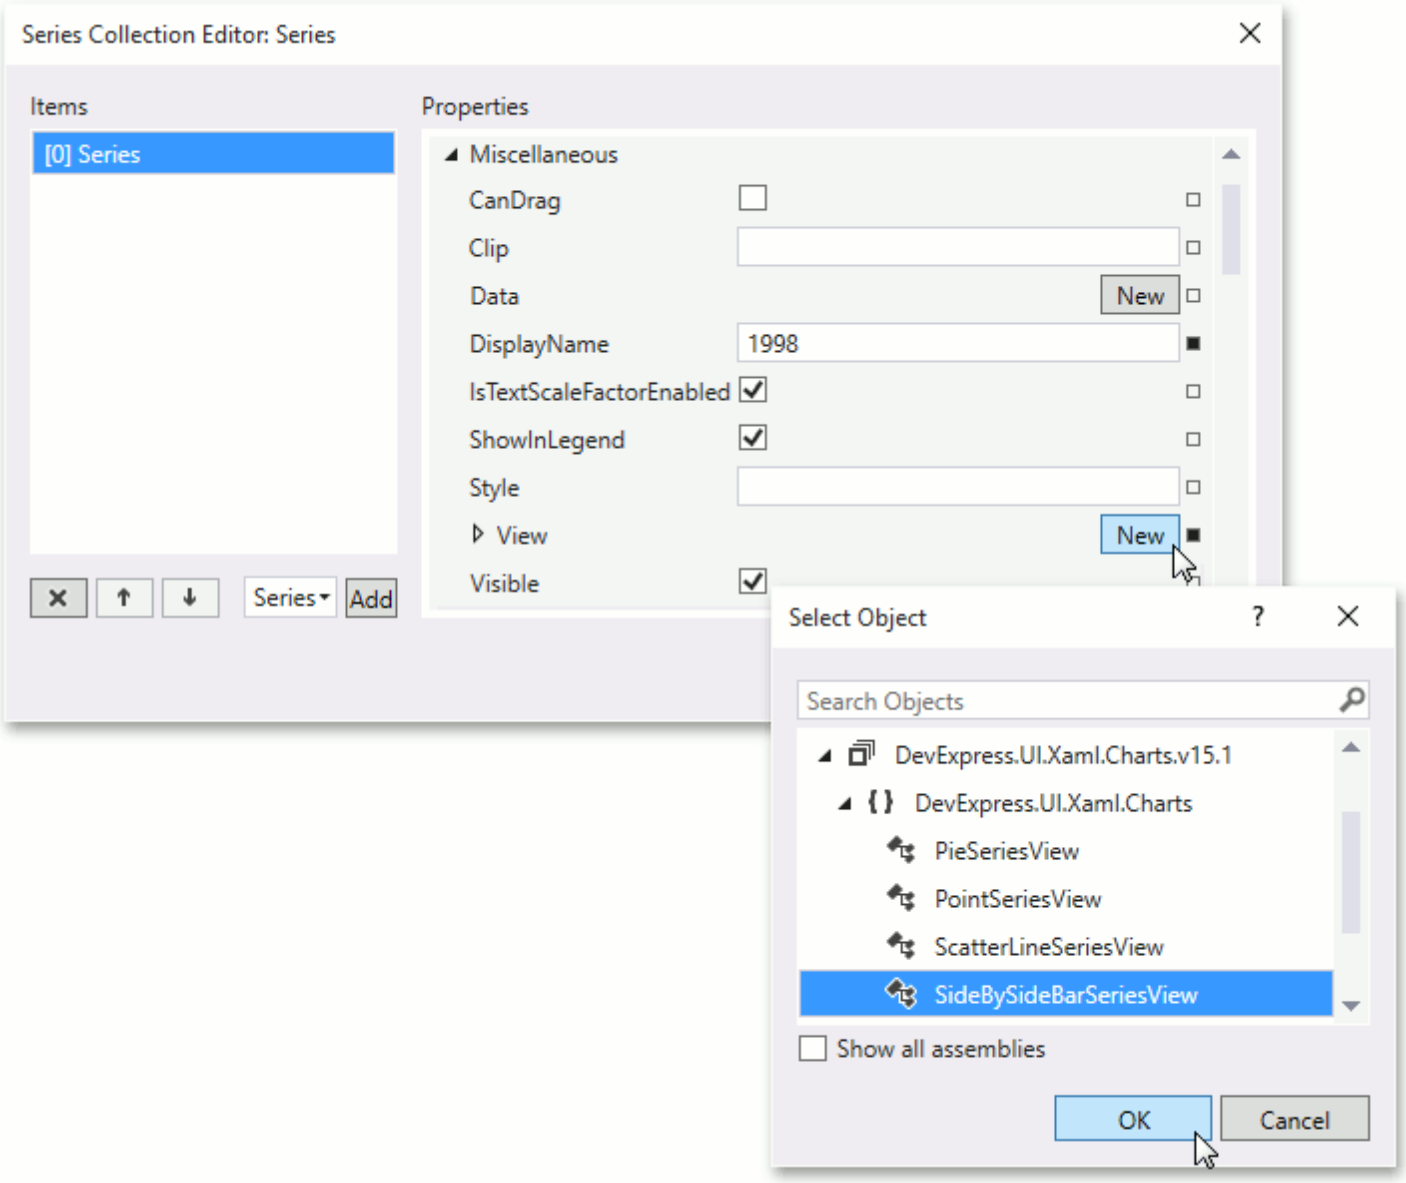


- Set the Series.DisplayName property to **1998**. The property value will be used to identify the series in the chart's legend.

© 2018 Developer Express Inc.

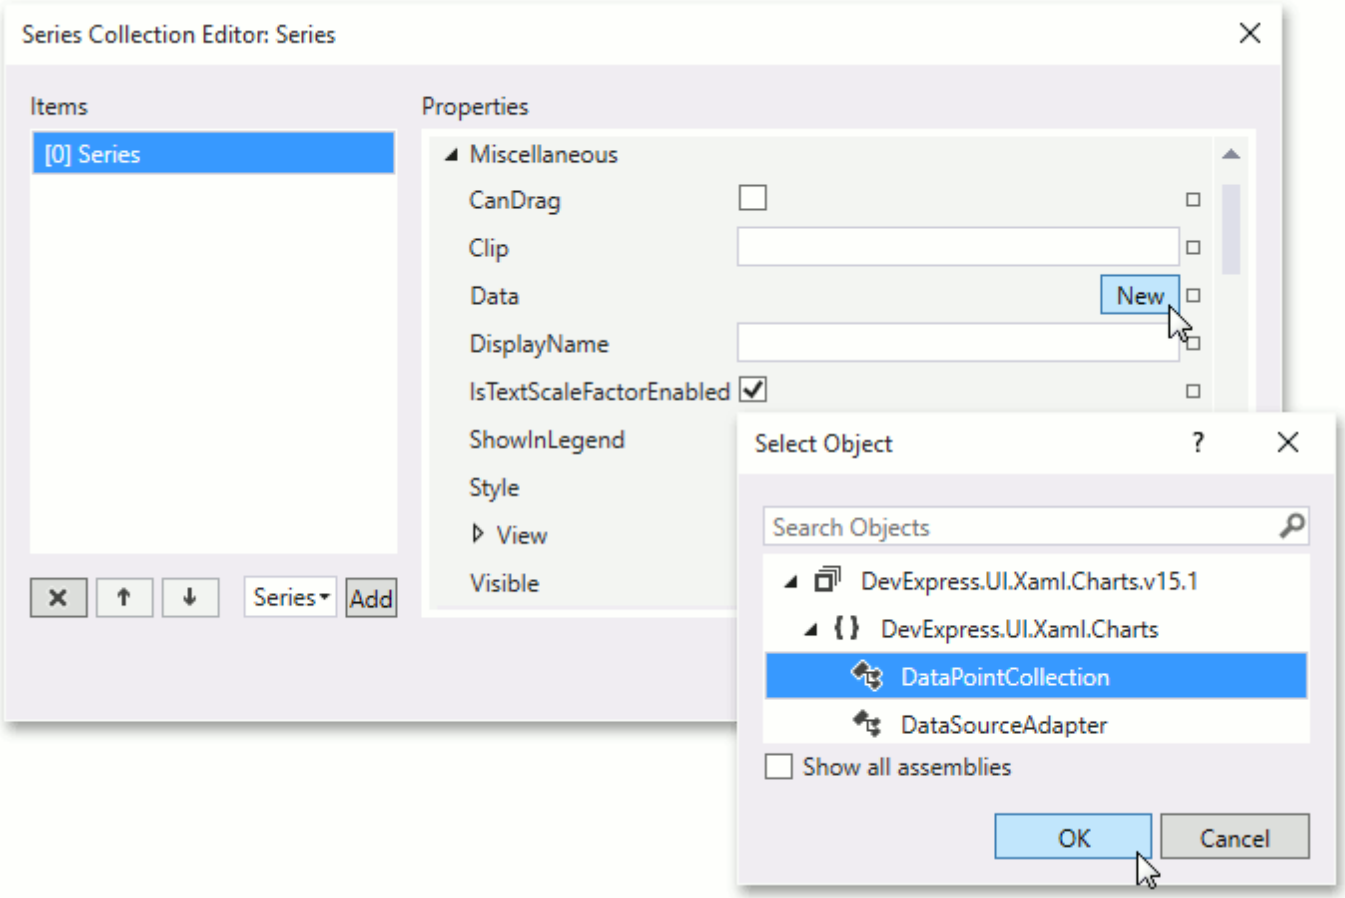


- After that, specify a series view for the series. To do this, assign a SideBySideBarSeriesView object to the Series.View property.



- To manually provide data for a series, it's necessary to assign a DataPointCollection object to the Series.Data property.

© 2018 Developer Express Inc.



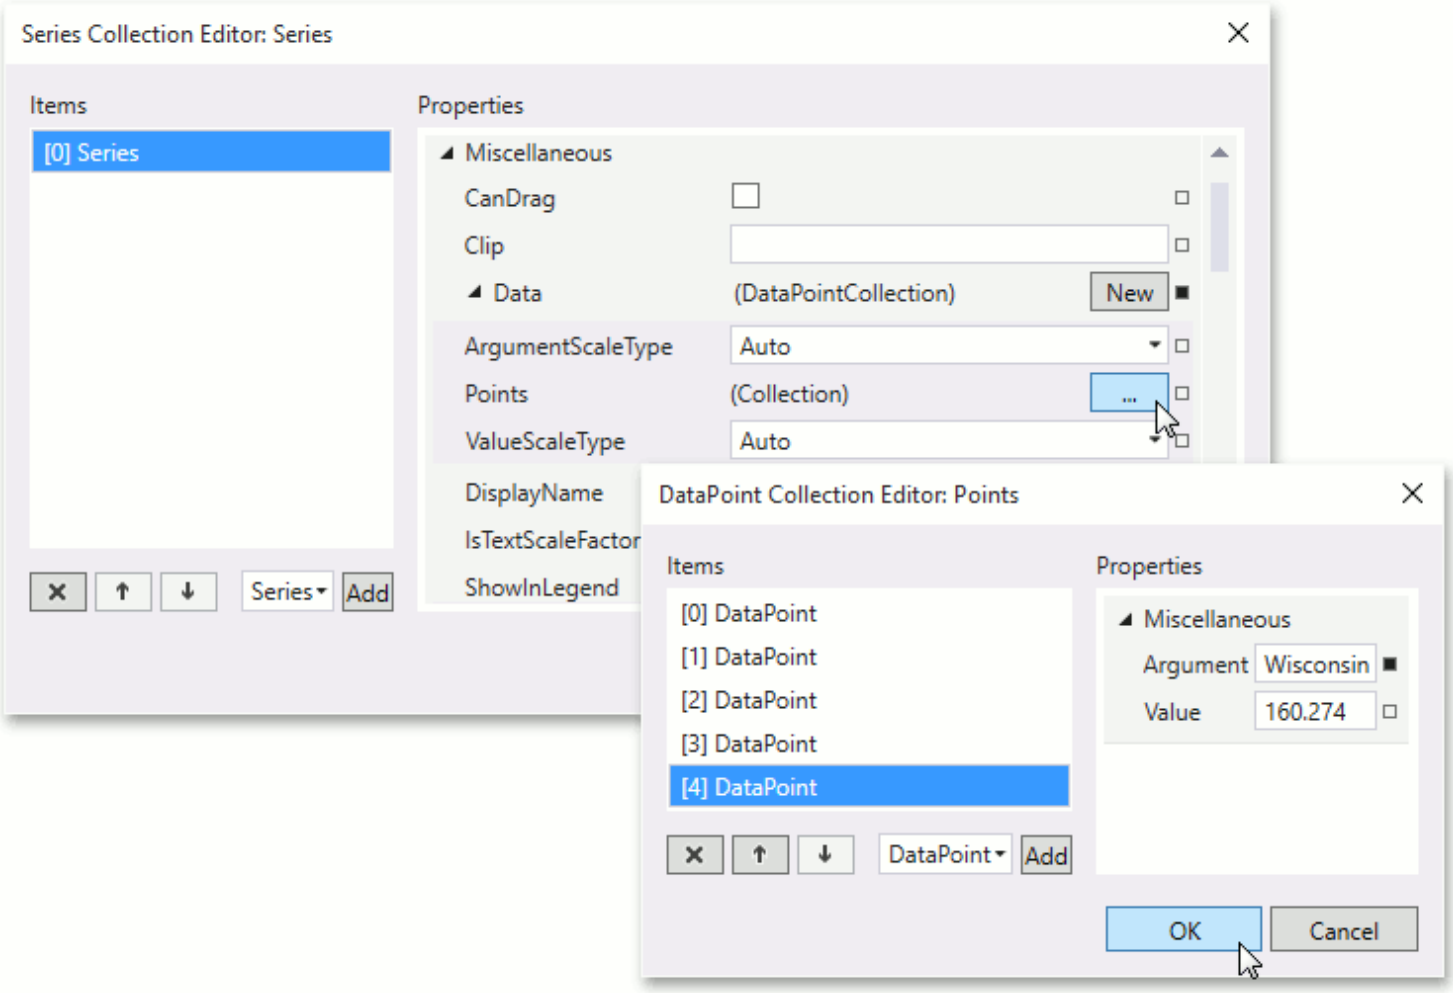
Note

It is possible to modify the DataPoint.ArgumentScaleType and DataPoint.ValueScaleType properties if you wish to disable automatic data type detection and explicitly specify how a chart should treat data in data points.

- Add the following DataPoint objects to the DataPointCollection.Points collection.

Argument	Value
Illinois	423.721
Indiana	178.719
Michigan	308.845
Ohio	348.555
Wisconsin	160.274

© 2018 Developer Express Inc.



- Repeat this step to add two series with names **2001** and **2004**. Populate this series with data point values and arguments represented in the table below.

Argument	2001 Series Value	2004 Series Value
Illinois	476.851	528.904
Indiana	195.769	227.271
Michigan	335.793	372.576
Ohio	374.771	418.258
Wisconsin	182.373	211.727

After completing this, the XAML should look like following.

Xaml	

© 2018 Developer Express Inc.

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="CartesianChartLesson.MainPage">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Charts:CartesianChart>
            <Charts:CartesianChart.Series>
                <Charts:Series
                    DisplayName="1998">
                    <Charts:Series.View>
                        <Charts:SideBySideBarSeriesView/>
                    </Charts:Series.View>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint
                            Argument="Illinois"
                            Value="423.721"/>
                        <Charts:DataPoint
                            Argument="Indiana"
                            Value="178.719"/>
                        <Charts:DataPoint
                            Argument="Michigan"
                            Value="308.845"/>
                        <Charts:DataPoint
                            Argument="Ohio"
                            Value="348.555"/>
                        <Charts:DataPoint
                            Argument="Wisconsin"
                            Value="160.274"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
                <Charts:Series
                    DisplayName="2001">
                    <Charts:Series.View>
                        <Charts:SideBySideBarSeriesView/>
                    </Charts:Series.View>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint
                            Argument="Illinois"
                            Value="476.851"/>
                        <Charts:DataPoint
                            Argument="Indiana"
                            Value="195.769"/>
                        <Charts:DataPoint
                            Argument="Michigan"
                            Value="335.793"/>
                        <Charts:DataPoint
                            Argument="Ohio"
                            Value="374.771"/>
                        <Charts:DataPoint
                            Argument="Wisconsin"
                            Value="182.373"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
                <Charts:Series
                    DisplayName="2004">
                    <Charts:Series.View>
                        <Charts:SideBySideBarSeriesView/>
                    </Charts:Series.View>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint
                            Argument="Illinois"
                            Value="528.904"/>
                        <Charts:DataPoint
                            Argument="Indiana"
```

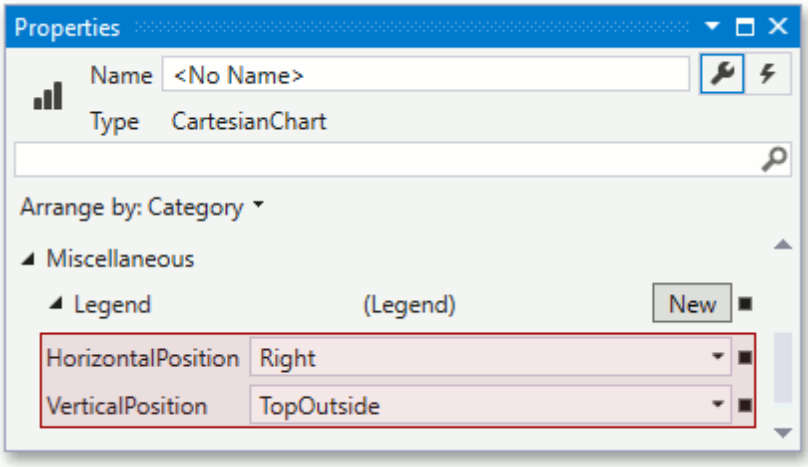
© 2018 Developer Express Inc.

```
                            Value="227.271"/>
                        <Charts:DataPoint
                            Argument="Michigan"
                            Value="372.576"/>
                        <Charts:DataPoint
                            Argument="Ohio"
                            Value="418.258"/>
                        <Charts:DataPoint
                            Argument="Wisconsin"
                            Value="211.727"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
            </Charts:CartesianChart.Series>
        </Charts:CartesianChart>
    </Grid>
</Page>
```

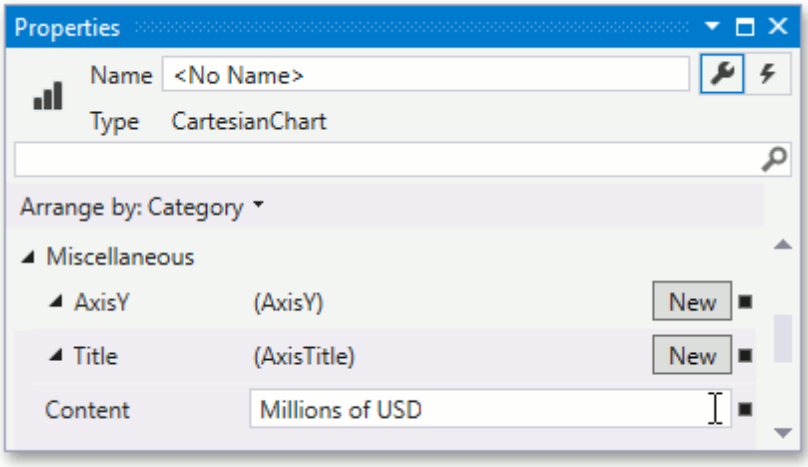
Step 3. Customize the Chart

In this step, customize the chart's legend and the Y-axis to improve chart readabilty.

- By default, the chart doesn't show a legend. If you wish to display it, simply assign the Legend object to the ChartBase.Legend property. To change the legend's position, modify its Legend.HorizontalPosition and Legend.VerticalPosition property values.

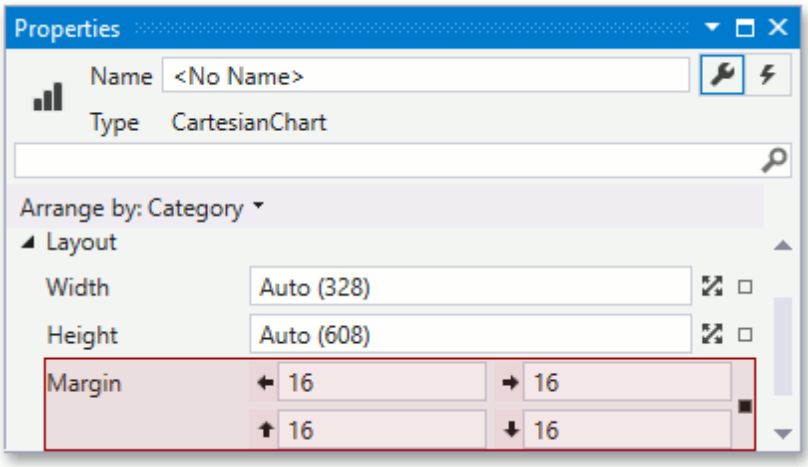


- To add the Y-axis title, assign a AxisY object to the CartesianChart.AxisY property, then assign the AxisTitle object to the AxisBase.Title property. After that, it is possible to customize the title's parameters, e.g., set the AxisTitle.Content property to **Millions of USD**.



- To add margins to the chart, set its **Windows.UI.Xaml.FrameworkElement.Margin** property to **16**.

© 2018 Developer Express Inc.



Result

Now our chart is ready. Your code and XAML should look as follows.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T280057.

Xaml

```
 (MainPage.xaml)
<Page
    x:Class="CartesianChartLesson.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts">

                        <Charts:DataPoint
                            Argument="Indiana"
                            Value="227.271"/>
                        <Charts:DataPoint
                            Argument="Michigan"
                            Value="372.576"/>
                        <Charts:DataPoint
                            Argument="Ohio"
                            Value="418.258"/>
                        <Charts:DataPoint
                            Argument="Wisconsin"
                            Value="211.727"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
            </Charts:CartesianChart.Series>
        </Charts:CartesianChart>
    </Grid>
</Page>
```

Run the project. The following image illustrates the resulting chart at runtime.

Lesson 2 - Creating a Pie Chart

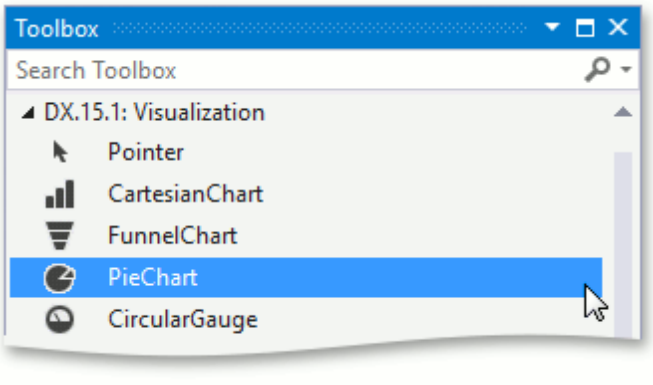
This lesson demonstrates how to create a simple Pie chart with a single Pie series, populate the chart with data and adjust common settings.

Do the following to create a simple chart application.

- Step 1. Create a New Project and Add a Chart
- Step 2. Provide Chart Data
- Step 3. Customize the Chart's View
- Result

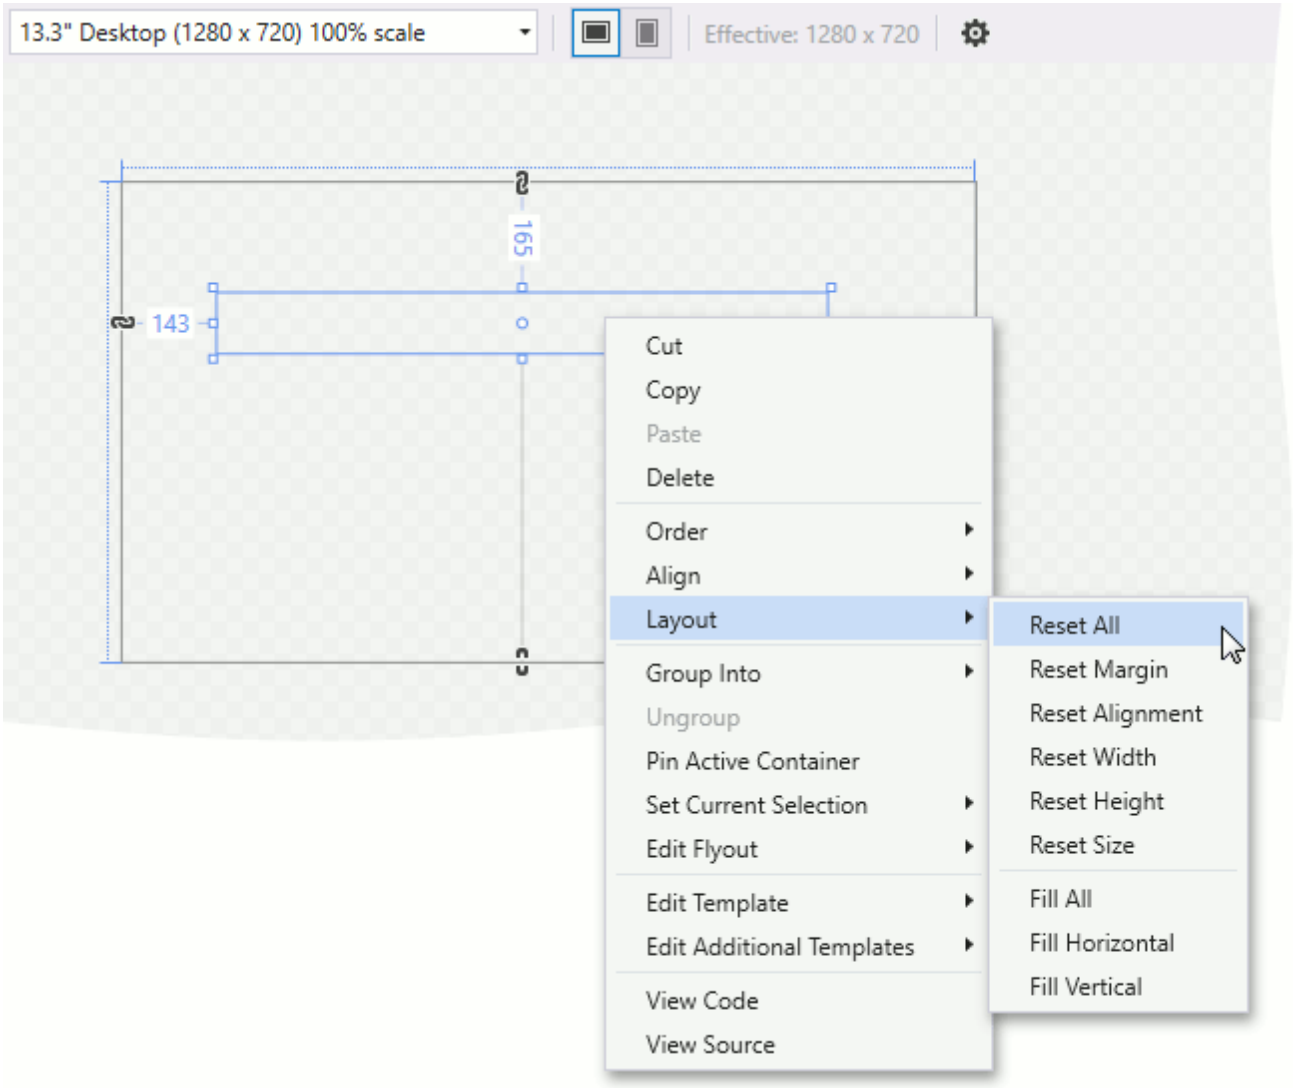
Step 1. Create a New Project and Add a Chart Control

To do this, run MS Visual Studio 2015 or 2017. Create a new application by choosing **New Project** from the **File** menu or by pressing **Ctrl+Shift+N**. Next, select **Universal**, and then choose **Blank App (Universal Windows)**. Switch to the **MainPage.xaml** design view and add the PieChart control to the main page by dragging and dropping the **PieChart** item from the **DX.18.1: Visualization** toolbox tab.



Right-click the **PieChart** object and choose the **Layout | Reset All** option in the context menu. This will stretch the chart to fill the entire window.

© 2018 Developer Express Inc.



Note

The following SDK extensions will be added to the References list of your project: *DevExpress.Core* and *DevExpress.Visualization*.

Your XAML may look like the following code. If it doesn't, you can overwrite your code as follows:

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="PieChart.MainPage">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Charts:PieChart/>
    </Grid>
</Page>
```

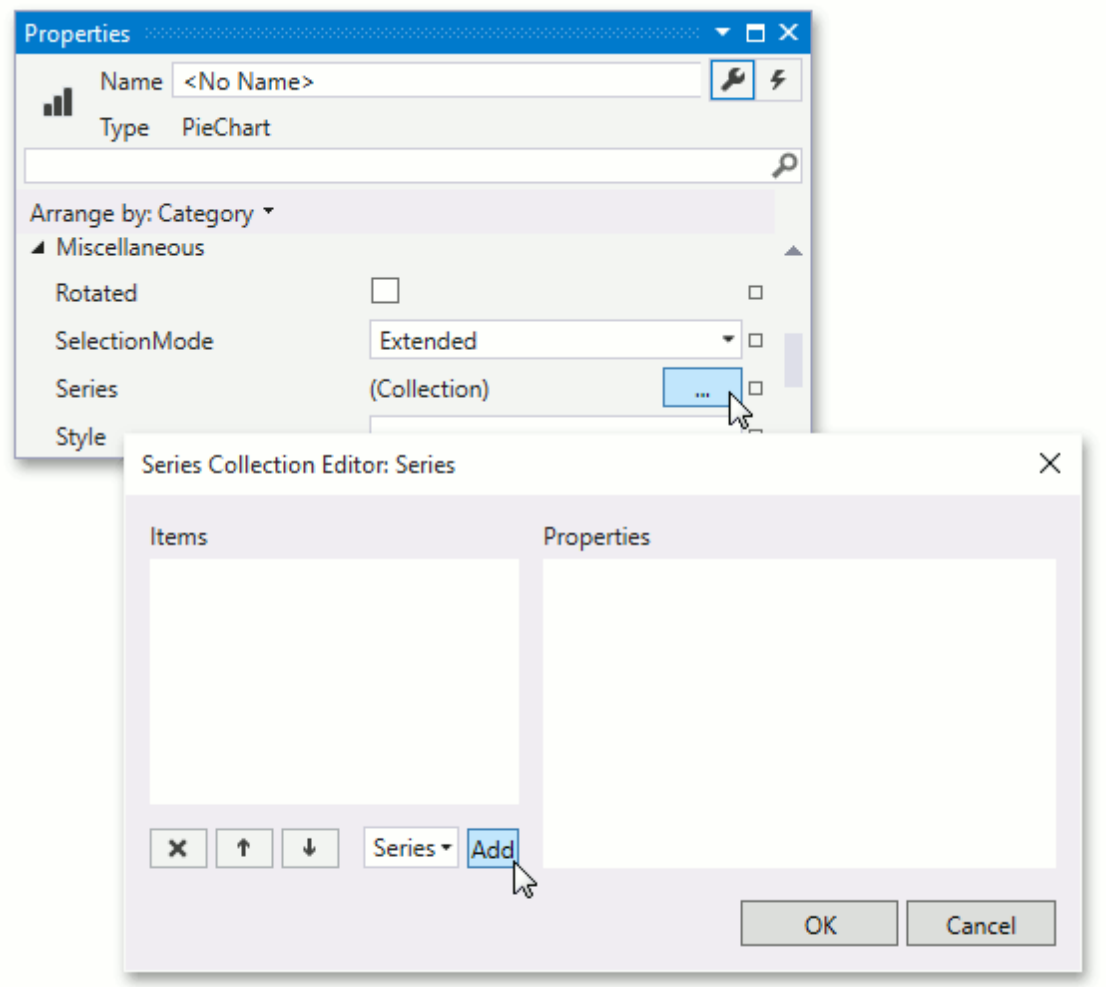
Let's proceed to the next step, and see how to add a series to the chart and provide series points with data.

Step 2. Provide Chart Data

First, you need to fill the chart with data. Let's start by adding a series.

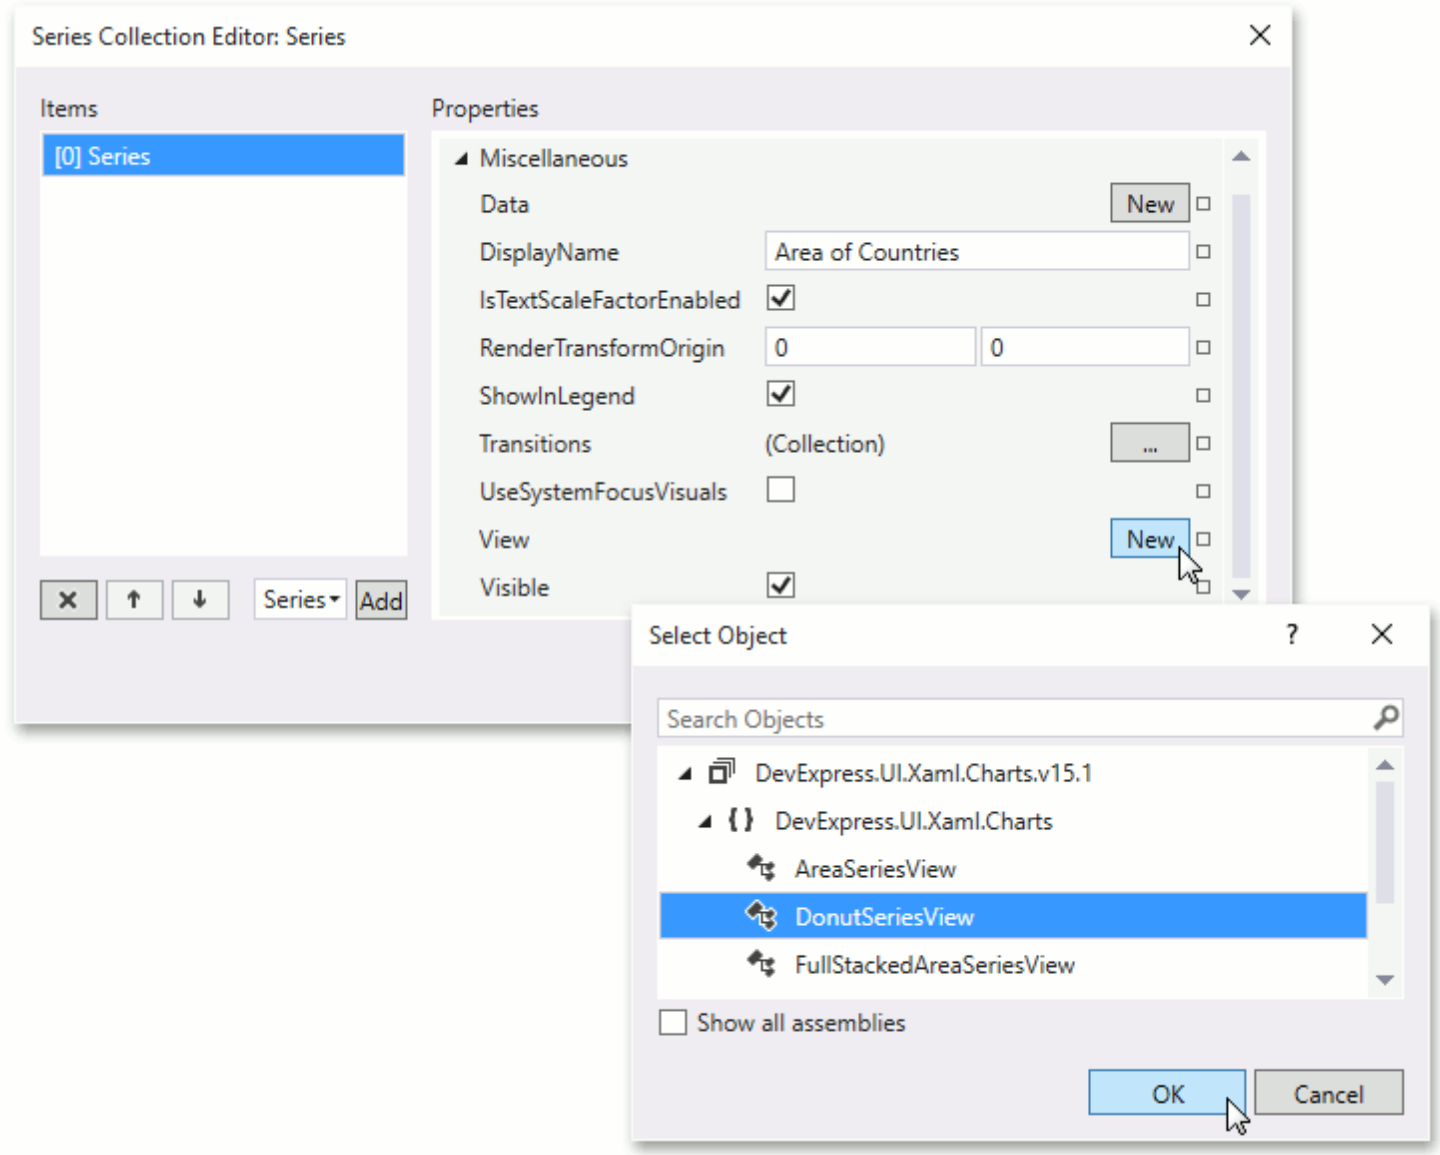
- For the **PieChart** control, locate the ChartBase.Series property and click the ellipsis button to invoke the **Object Collection Editor: Series** dialog. Add one Series object to the collection in this dialog.

© 2018 Developer Express Inc.



- Next, specify a series view for the series by setting the Series.View property to PieSeriesView.

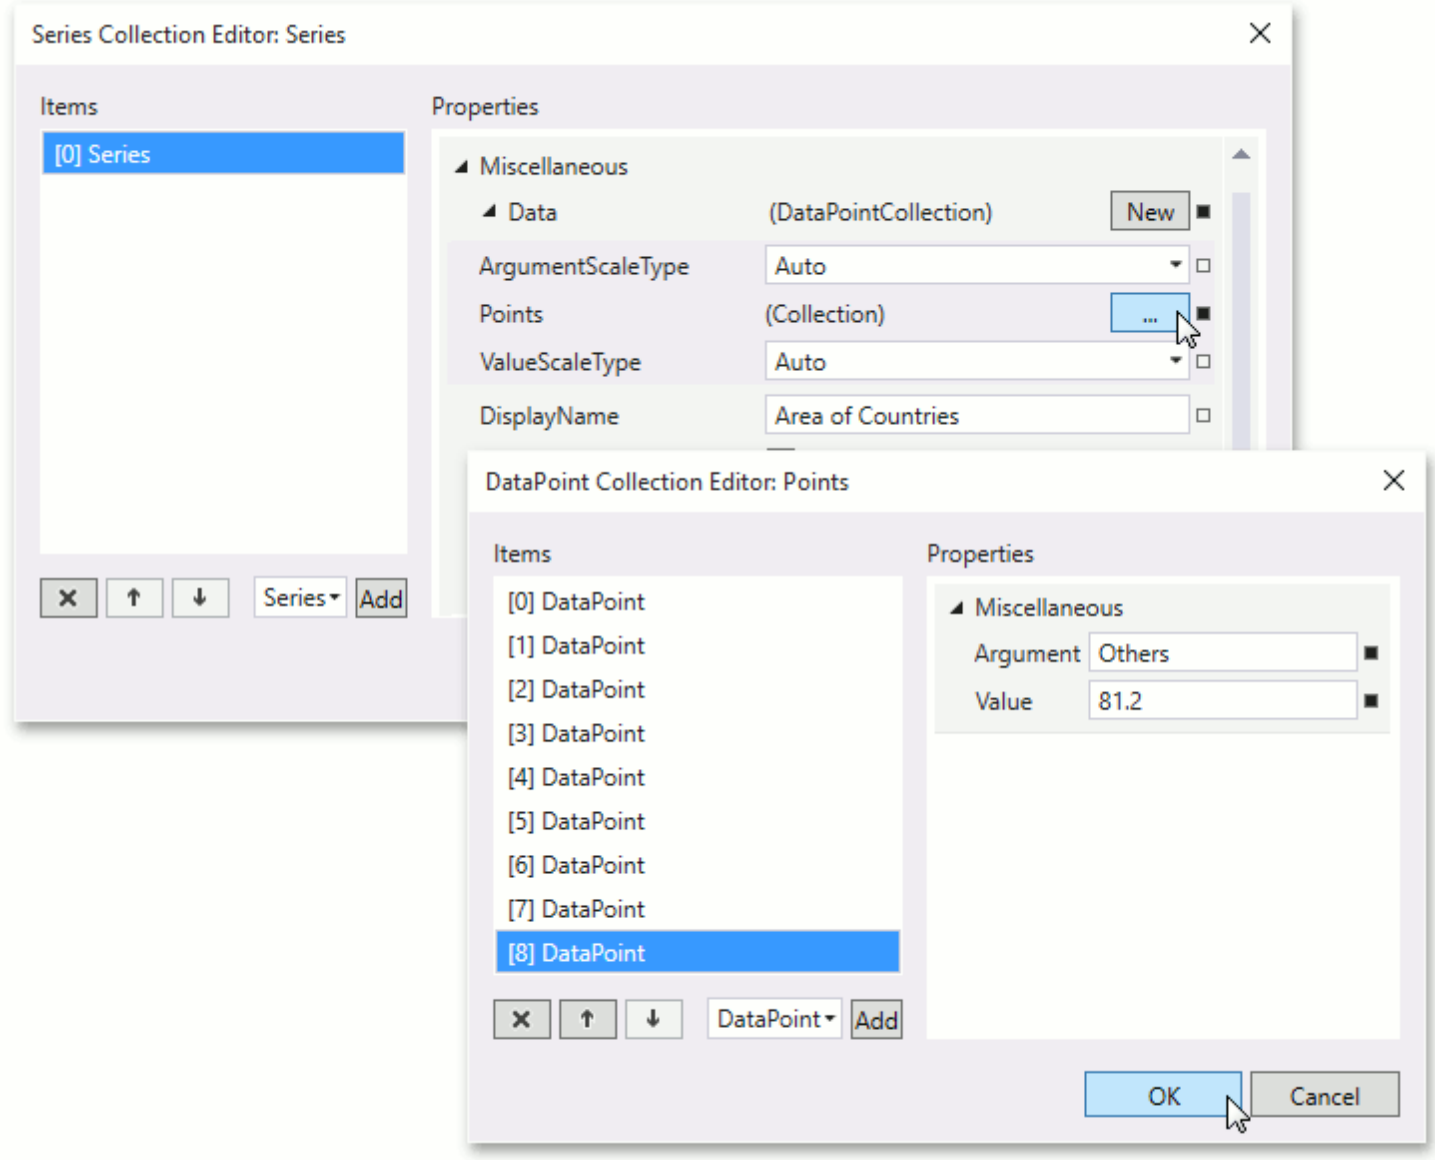
© 2018 Developer Express Inc.



- To provide data for a series, it is necessary to assign a DataPointCollection to the Series.Data property and fill it with DataPoint objects. To do this, add data points with the following arguments and values.

Argument	Value
Russia	17.0752
Canada	9.98467
USA	9.63142
China	9.59696
Brazil	8.511965
Australia	7.68685
India	3.28759
Others	81.2

© 2018 Developer Express Inc.

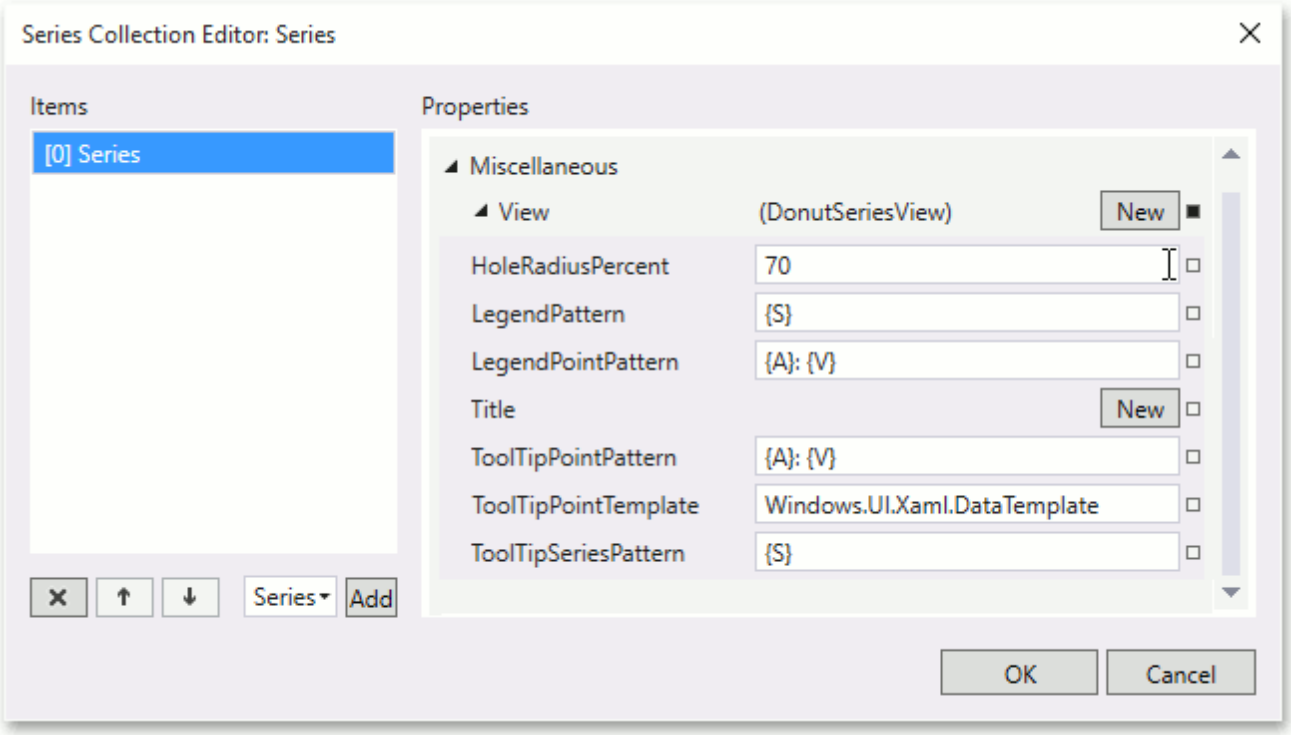


Step 3. Customize the Chart's View

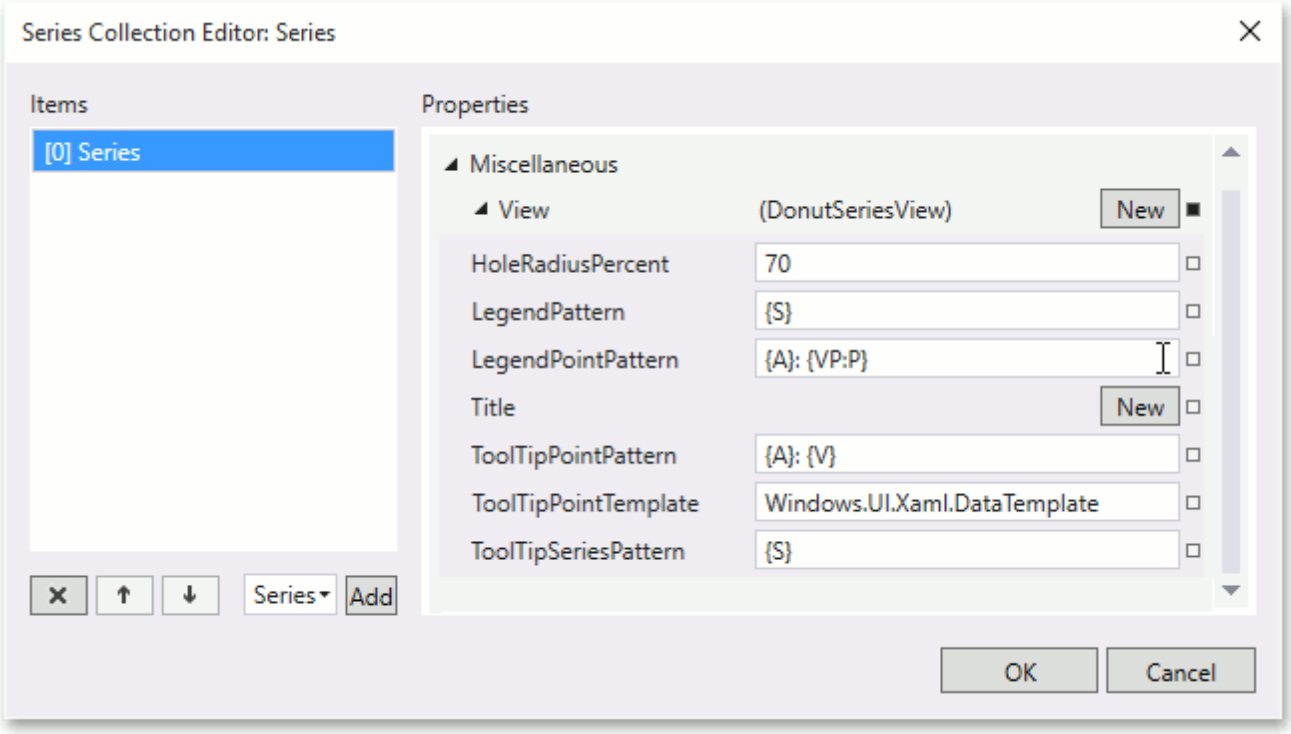
In this step, the view of the chart will be customized.

- To customize the donut hole in the chart, set the DonutSeriesView.HoleRadiusPercent property to 70.

© 2018 Developer Express Inc.

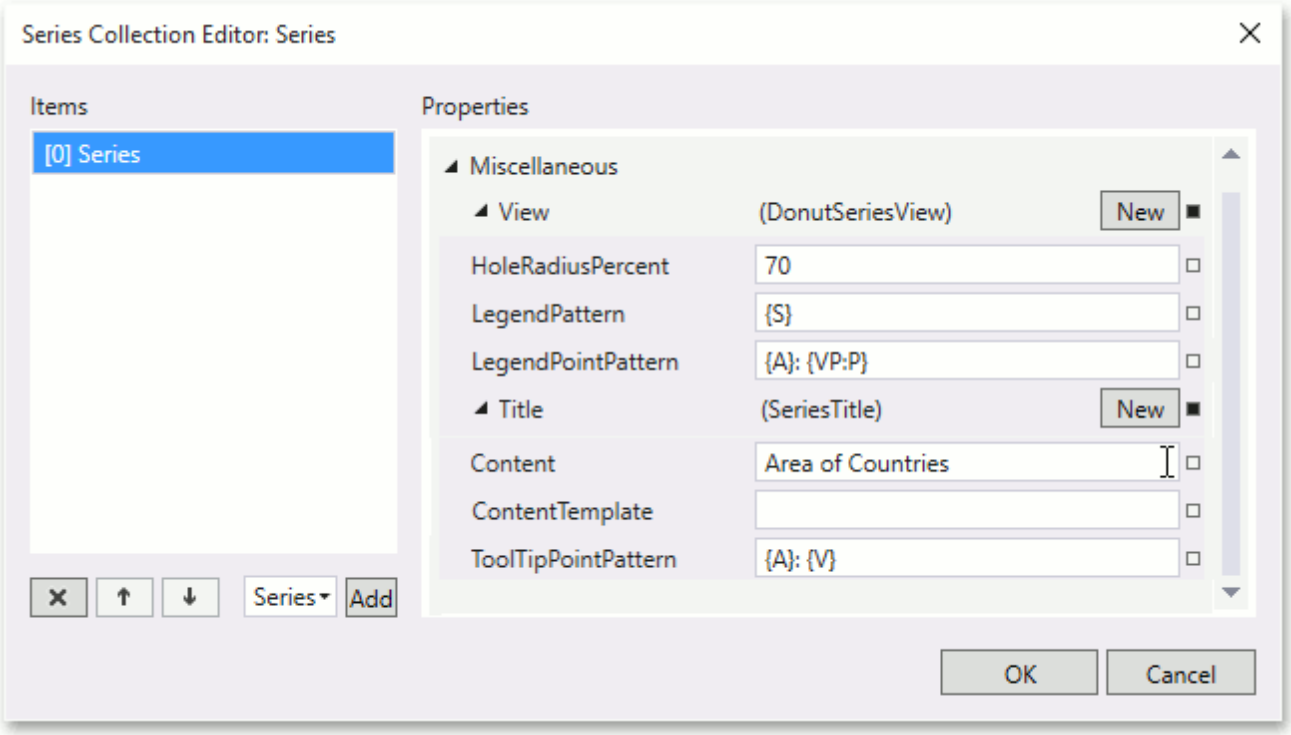


- Change how the data points are described in the legend. To do this, set the view's SeriesView.LegendPointPattern property to **{A}: {VP:P}**.

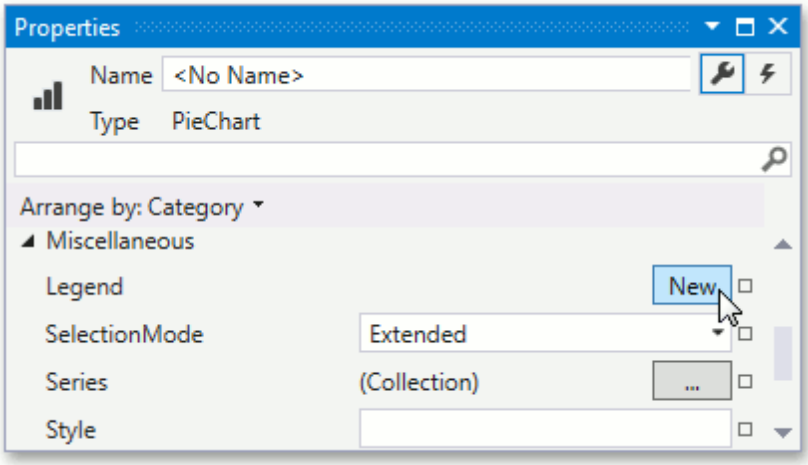


- To explain the meaning of the diagram, add a title to donut, specifying the PieSeriesView.Title property. Set the SeriesTitle.Content property to **Area of Countries**.

© 2018 Developer Express Inc.



- Add a legend to the chart. To do this, locate the ChartBase.Legend property and click the **New** button.



Result

Your chart is now ready. Your XAML should appear as follows:

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T280009.	

Xaml	

```
 (MainPage.xaml)
<Page xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="PieChartLesson.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
      xmlns:local="using:PieChartLesson">

        <local:MyConverter x:Key="converter"/>
    </Page.Resources>
    <Grid
        Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Charts:PieChart >
            <Charts:PieChart.Palette>
                <Charts:OfficePalette/>
            </Charts:PieChart.Palette>
            <Charts:PieChart.Legend>
                <Charts:Legend/>
            </Charts:PieChart.Legend>
            <Charts:PieChart.Series>
                <Charts:Series
                    x:Name="series"
                    DisplayName="Area of Countries">
                    <Charts:Series.View>
                        <Charts:DonutSeriesView
                            HoleRadiusPercent="70"
                            LegendPointPattern="{}{A}: {VP:P}">
                            <Charts:DonutSeriesView.Title>
                                <Charts:SeriesTitle
                                    Content="Area of Countries"/>
                            </Charts:DonutSeriesView.Title>
                        </Charts:DonutSeriesView>
                    </Charts:Series.View>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint
                            Argument="Russia"
                            Value="17.0752" />
                        <Charts:DataPoint
                            Argument="Canada"
                            Value="9.98467" />
                        <Charts:DataPoint
                            Argument="USA"
                            Value="9.63142" />
                        <Charts:DataPoint
                            Argument="China"
                            Value="9.59696" />
                        <Charts:DataPoint
                            Argument="Brazil"
                            Value="8.511965" />
                        <Charts:DataPoint
                            Argument="Australia"
                            Value="7.68685" />
                        <Charts:DataPoint
                            Argument="India"
                            Value="3.28759" />
                        <Charts:DataPoint
                            Argument="Others"
                            Value="81.2"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
            </Charts:PieChart.Series>
        </Charts:PieChart>
    </Grid>
</Page>
```

Run the project. The following image illustrates the resulting chart at runtime.

Lesson 3 - Creating a Funnel Chart

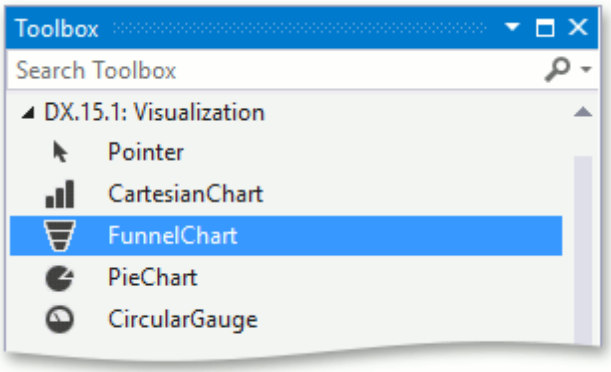
This lesson demonstrates how to create a Funnel chart with a single Funnel series, populate the chart with data and adjust common settings.

Do the following to create a simple chart application.

- Step 1. Create a New Project and Add a Chart
- Step 2. Provide Chart Data
- Step 3. Customize the Chart
- Result

Step 1. Create a New Project and Add a Chart

Run MS Visual Studio 2015 or 2017. Create a new Universal Windows Platform application by choosing **New Project** from the **File** menu or by pressing **Ctrl+Shift+N**. Next, select **Universal**, and then choose **Blank App (Universal Windows)**. Name this application "FunnelChartLesson" and click OK. Switch to the **MainPage.xaml** design view and add the FunnelChart control to the main page by dragging and dropping the **FunnelChart** item from the **DX.18.1: Visualization** toolbox tab.

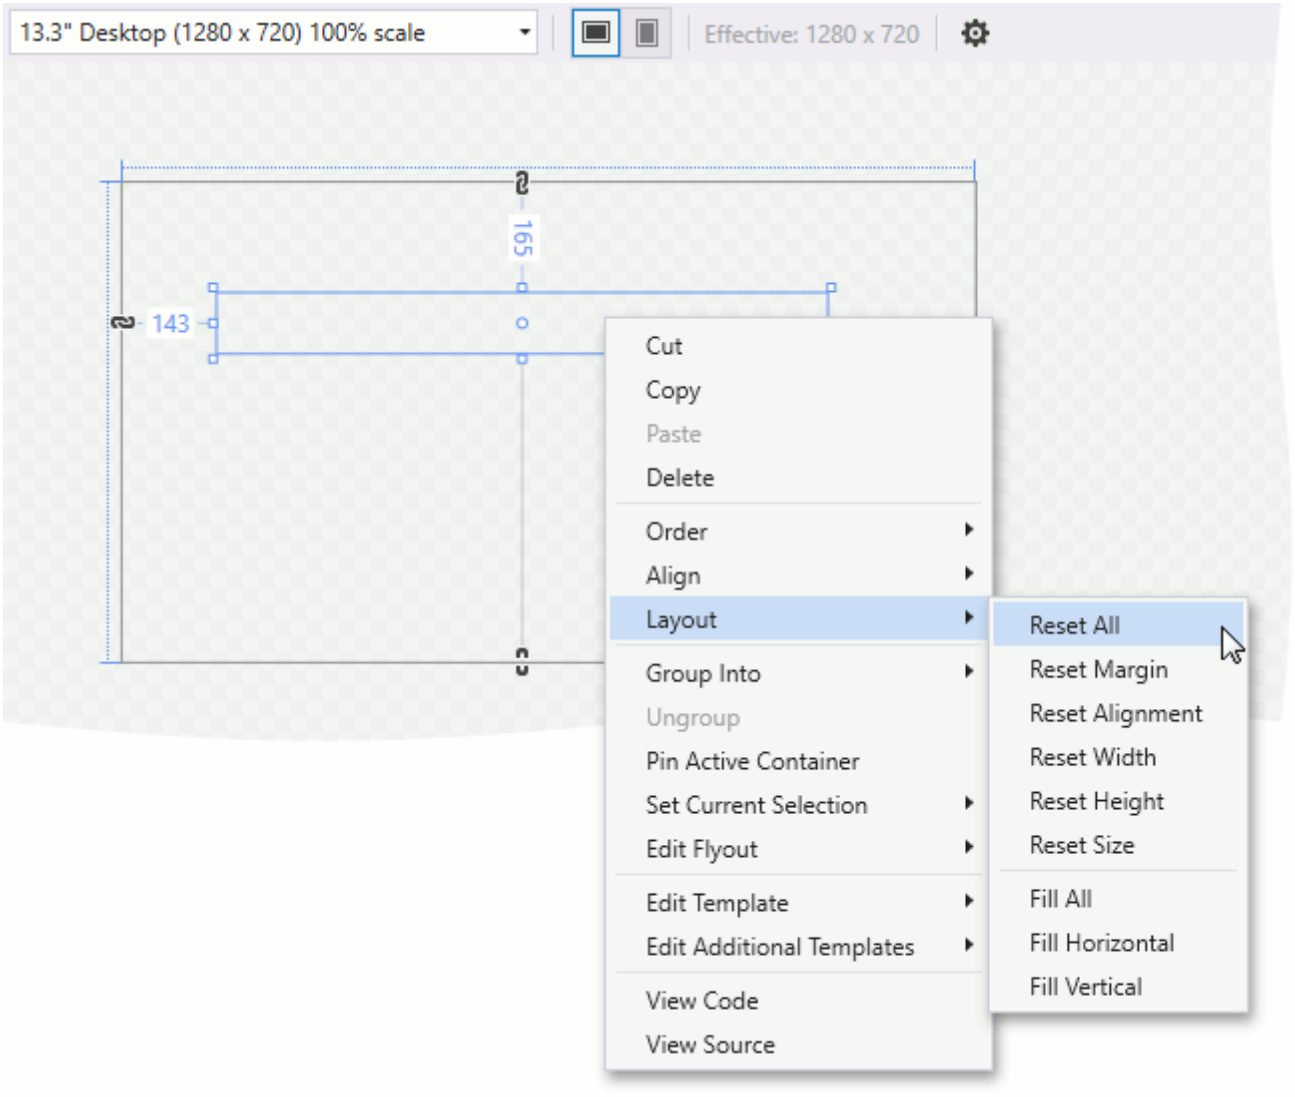


Note

The following SDK extensions will be added to the References list of your project: *DevExpress.Core* and *DevExpress.Visualization*.

Right-click the **FunnelChart** object and choose the **Layout | Reset All** option in the context menu. This will stretch the chart to fill the entire window.

© 2018 Developer Express Inc.



Your XAML should look like the following. If it doesn't, you can overwrite your code as follows.

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="FunnelChartLesson.MainPage">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Charts:FunnelChart/>
    </Grid>
</Page>
```

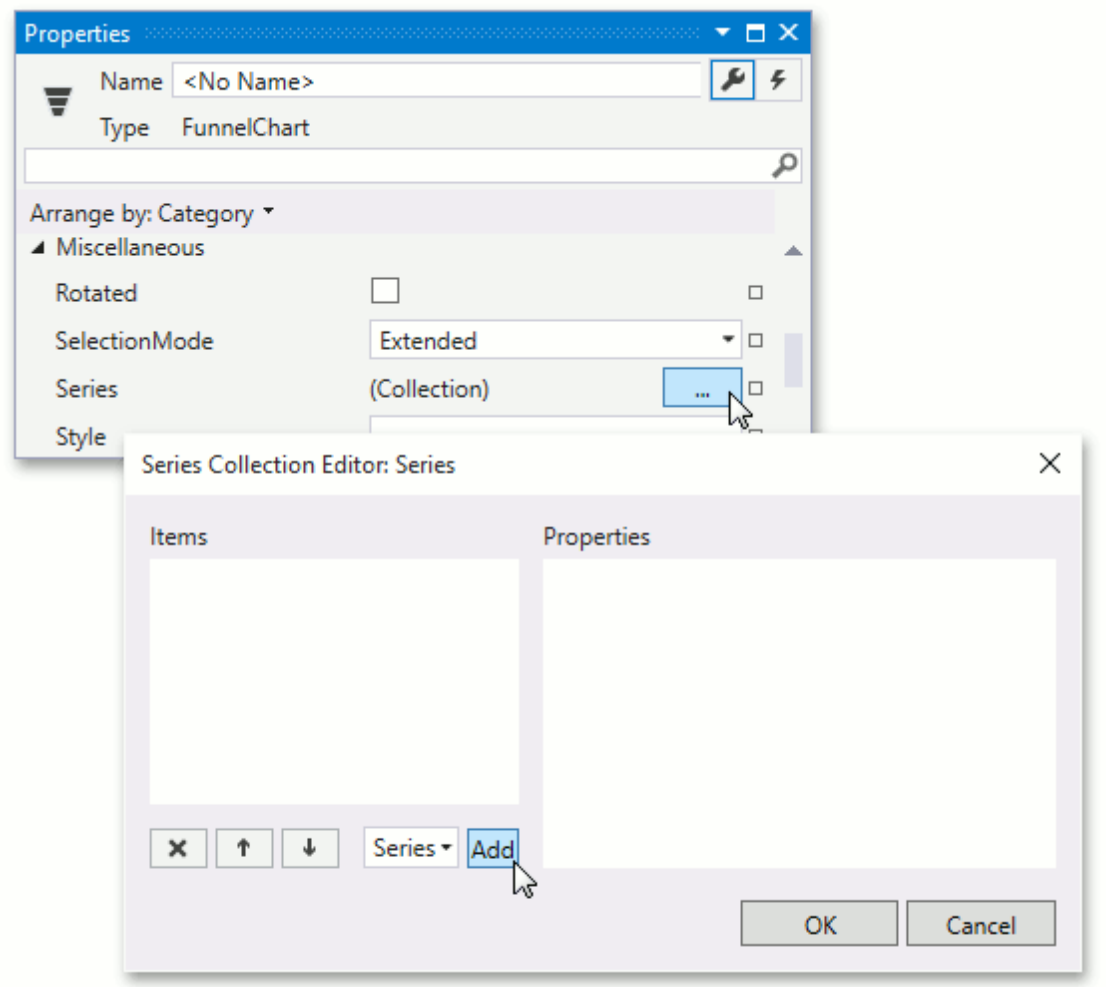
Proceed to the next step, and learn how to add a series to the chart and provide series points with data.

Step 2. Provide Chart Data

First, you need to fill the chart with data. Begin by adding a series.

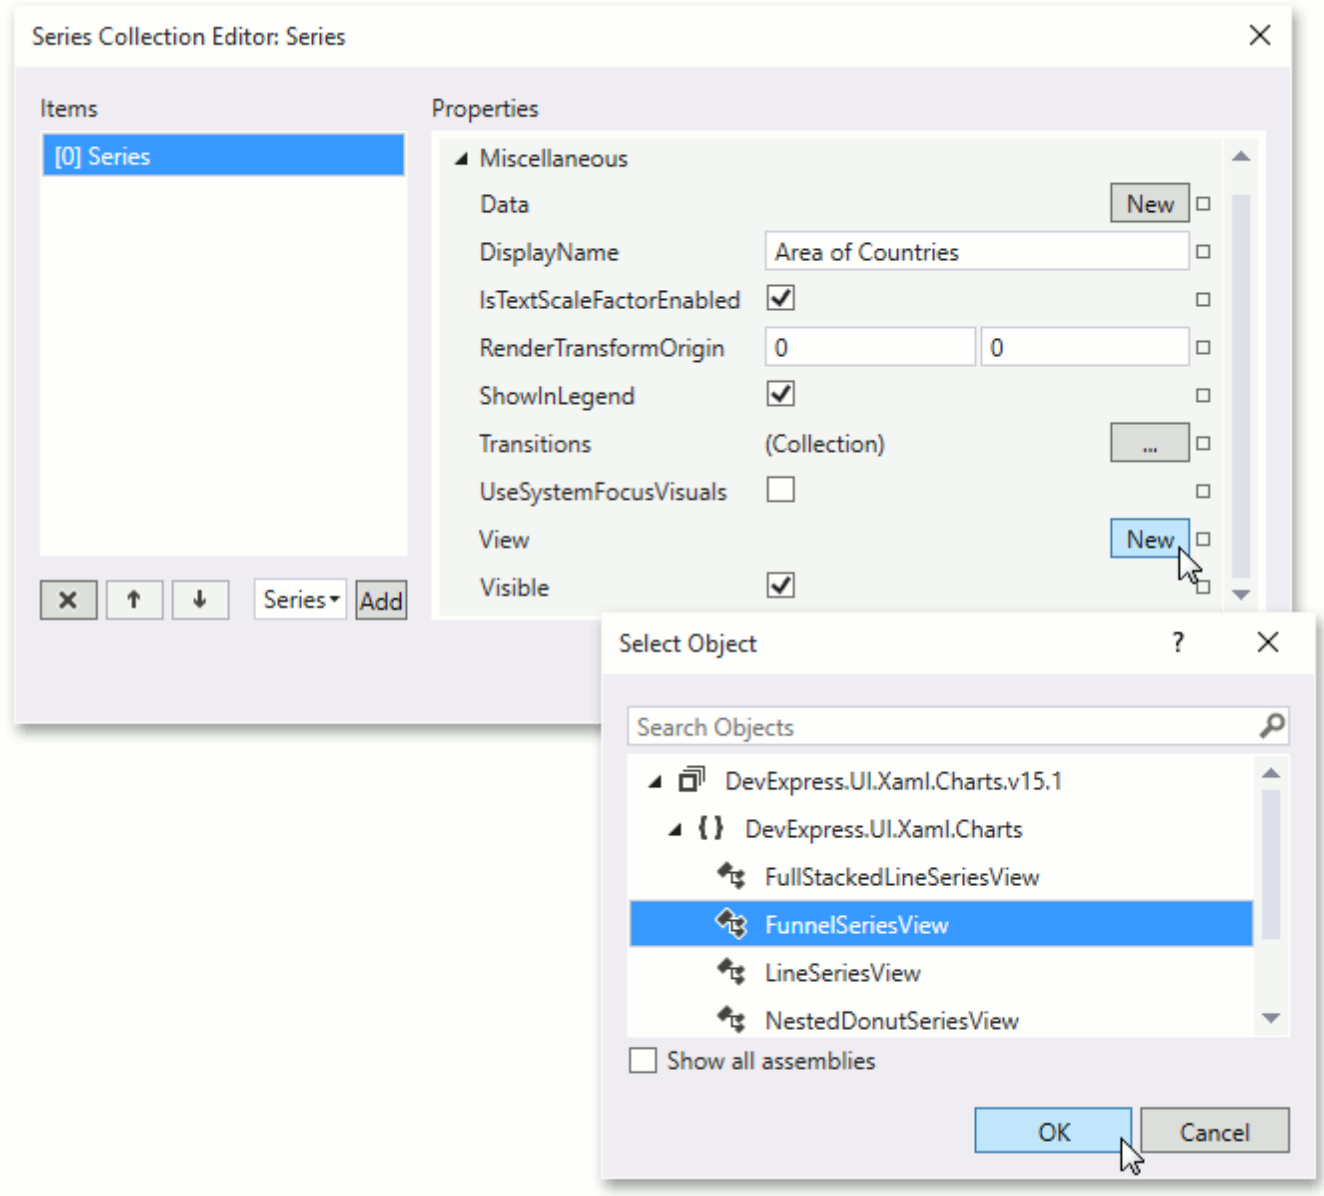
- For the **FunnelChart** control, locate the ChartBase.Series property in the **Properties** window and click the ellipsis button to invoke the **Series Collection Editor: Series** dialog. Add one Series object to the collection in this dialog.

© 2018 Developer Express Inc.



- Next, specify a series view for the series by setting the Series.View property to FunnelSeriesView.

© 2018 Developer Express Inc.

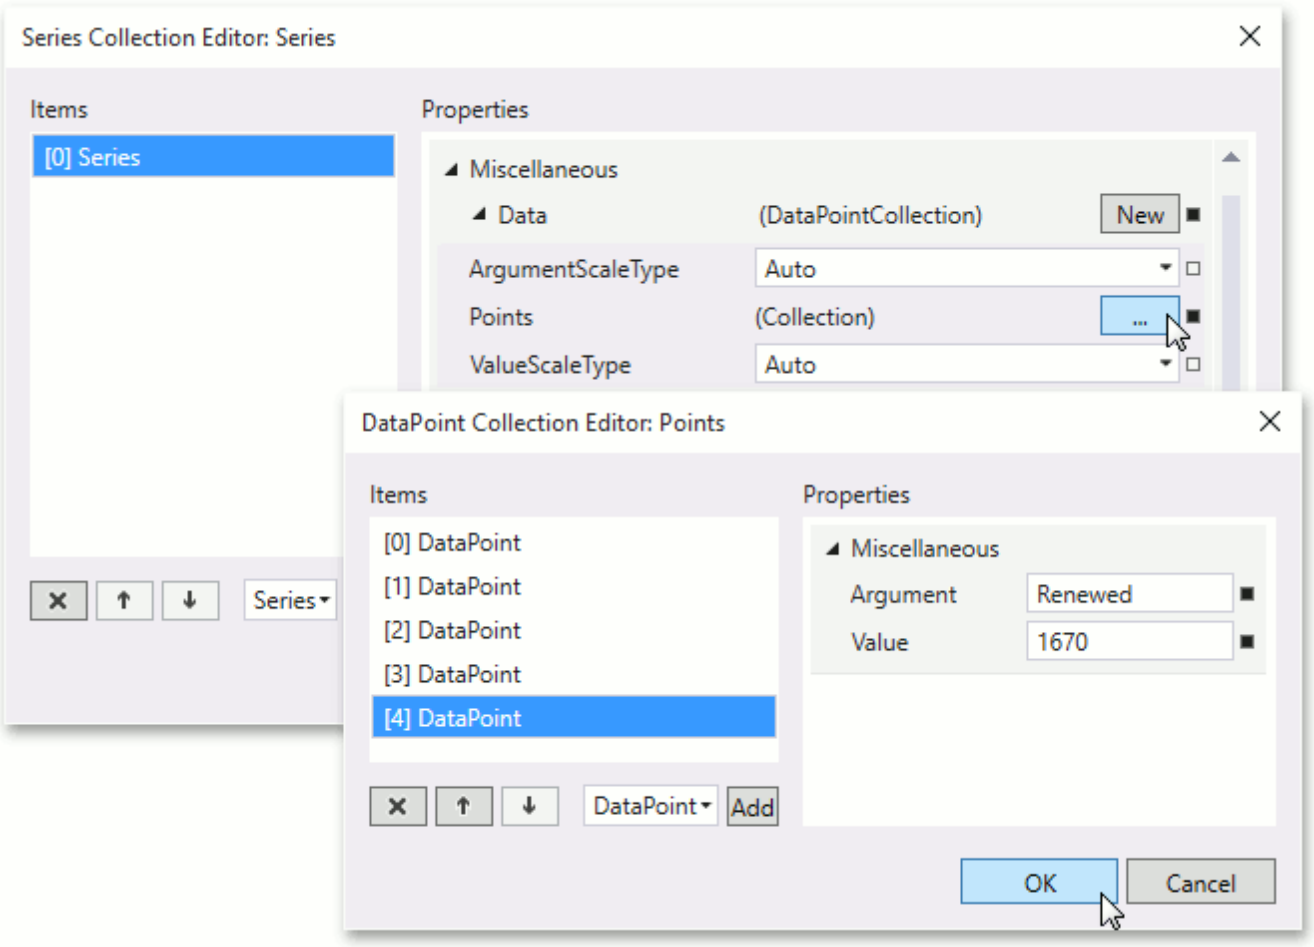


- To provide data for a series, it is necessary to assign a DataPointCollection to the Series.Data property and fill it with DataPoint objects.

Add data points with following arguments and values to the series.

Argument	Value
Visited a web site	9152
Download a trial	6870
Contacted to support	5121
Subscribed	2224
Renewed	1670

© 2018 Developer Express Inc.

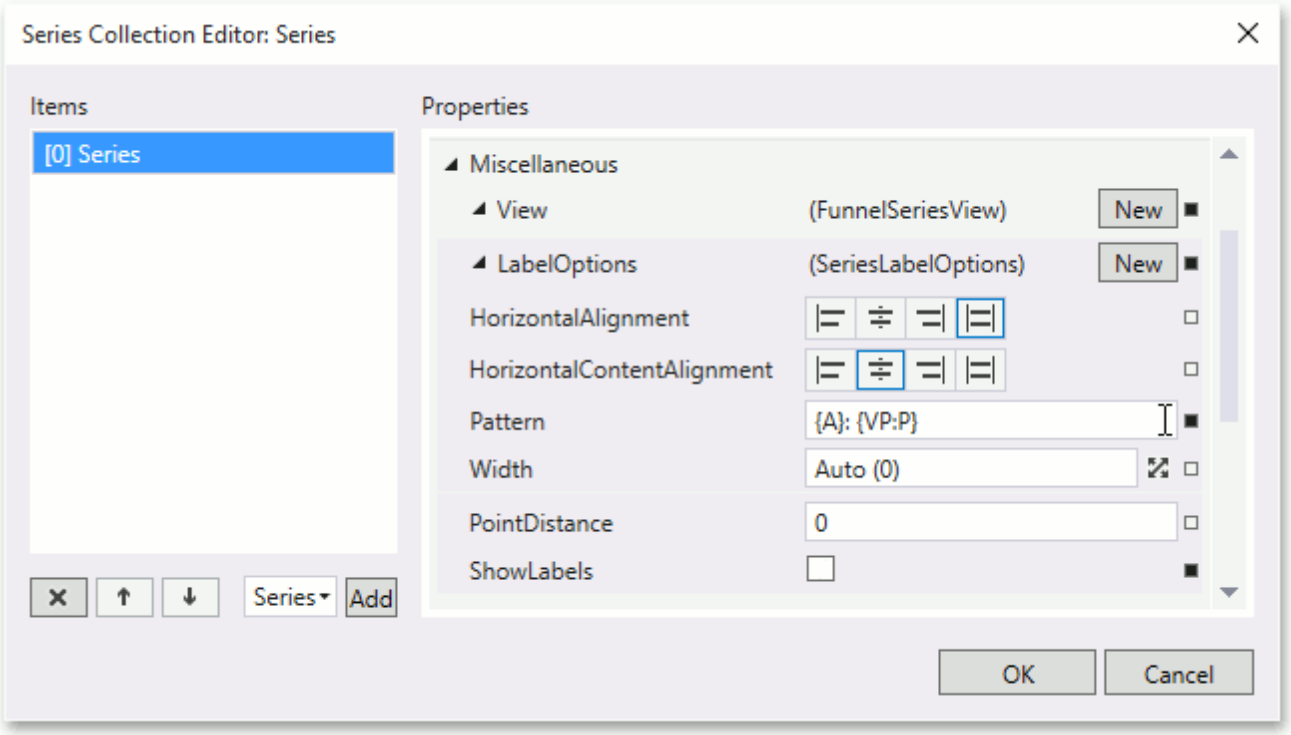


Step 3. Customize the Chart's Appearance

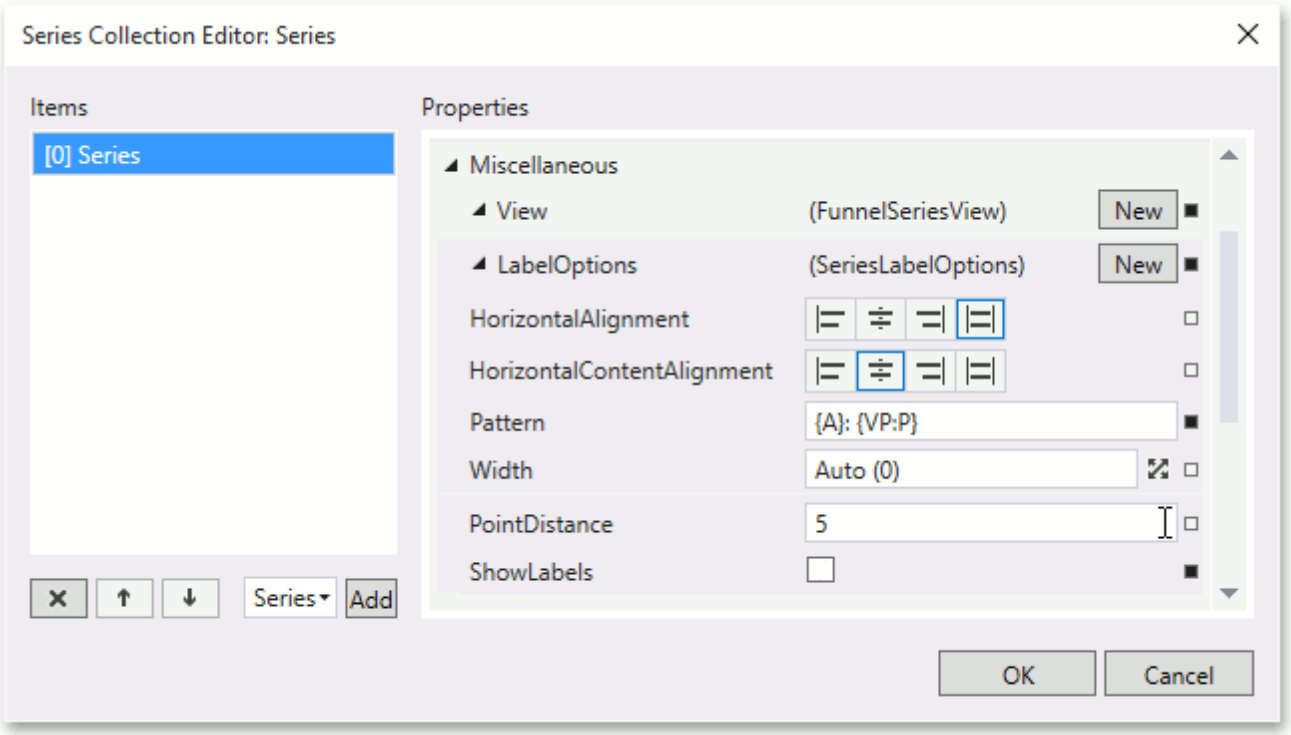
The chart is almost ready. Now adjust the chart to make it more attractive.

- To customize the text shown in the series point's label, customize the SeriesLabelOptions.Pattern property of an object stored in the SeriesView.LabelOptions property. Set the property to **{A}: {VP:P}**.

© 2018 Developer Express Inc.

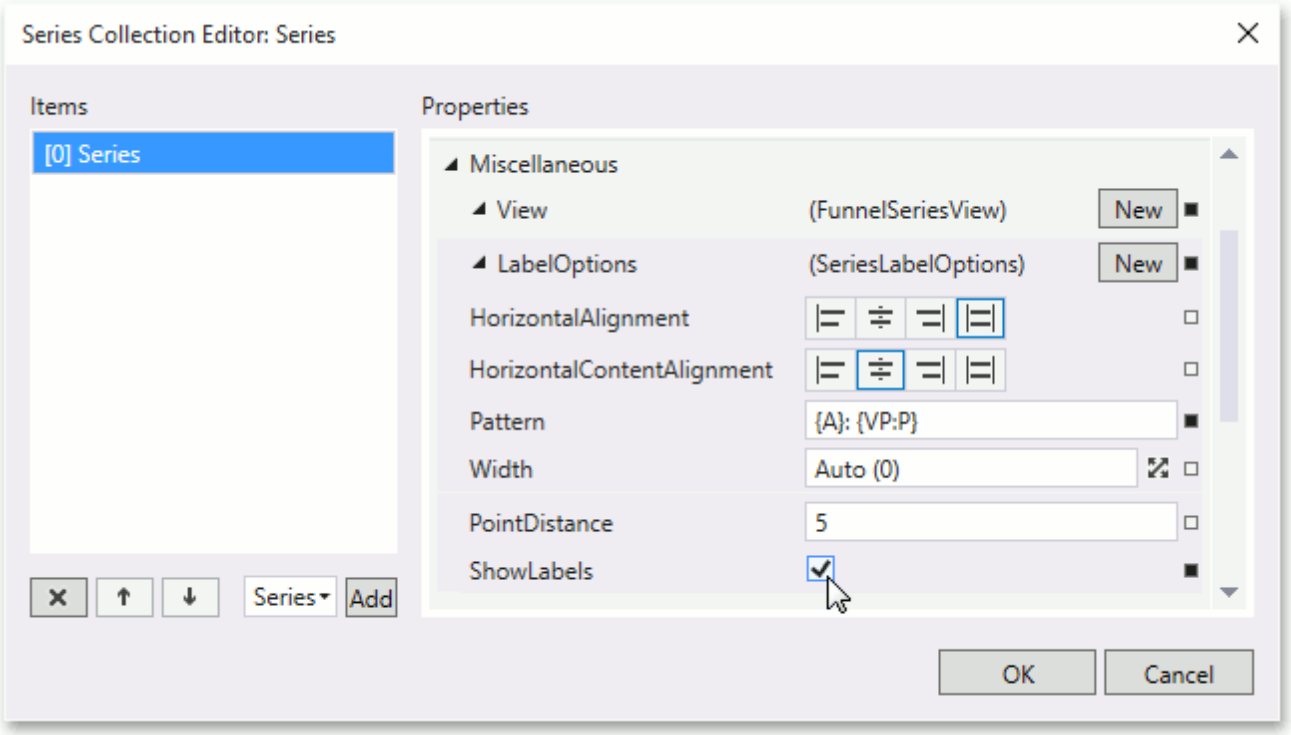


- To specify the distance between points of a Funnel series, set the FunnelSeriesView.PointDistance property to **5**.



- To show labels, set the SeriesView.ShowLabels property to **true**.

© 2018 Developer Express Inc.

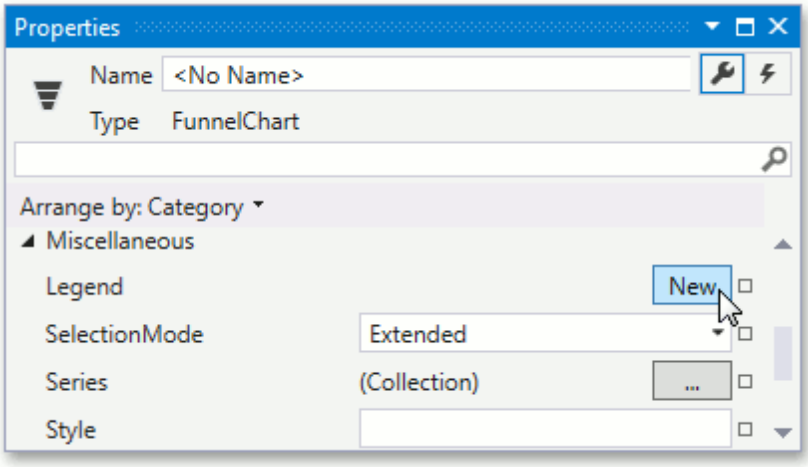


- To configure the label position, specify the FunnelSeriesView.LabelPosition attached property. Set the property to FunnelLabelPosition.RightColumn.

Xaml

```
<!-- -->
<Charts:FunnelSeriesView.LabelOptions>
    <Charts:SeriesLabelOptions
        Pattern="{}{A}: {VP:P}"
        Charts:FunnelSeriesView.LabelPosition="Right"/>
</Charts:FunnelSeriesView.LabelOptions>
<!-- -->
```

- The chart does not show a legend by default. If you wish to display one, simply assign the Legend object to the ChartBase.Legend property.



Result

The chart is now ready. Your XAML should appear as follows.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279989.	

Xaml

```
 (MainPage.xaml)
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="FunnelChartLesson.MainPage">
    <Grid
        Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Charts:FunnelChart>
            <Charts:FunnelChart.Palette>
                <Charts:OfficePalette/>
            </Charts:FunnelChart.Palette>
            <Charts:FunnelChart.Series>
                <Charts:Series>
                    <Charts:Series.View>
                        <Charts:FunnelSeriesView
                            PointDistance="5"
                            ShowLabels="True">
                            <Charts:FunnelSeriesView.LabelOptions>
                                <Charts:SeriesLabelOptions
                                    Pattern="{}{A}: {VP:P}"
                                    Charts:FunnelSeriesView.LabelPosition="RightColumn"/>
                            </Charts:FunnelSeriesView.LabelOptions>
                        </Charts:FunnelSeriesView>
                    </Charts:Series.View>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint
                            Argument="Visited a web site"
                            Value="9152"/>
                        <Charts:DataPoint
                            Argument="Downloaded a trial"
                            Value="6870"/>
                        <Charts:DataPoint
                            Argument="Contacted to support"
                            Value="5121"/>
                        <Charts:DataPoint
                            Argument="Subscribed"
                            Value="2224"/>
                        <Charts:DataPoint
                            Argument="Renewed"
                            Value="1670"/>
                    </Charts:DataPointCollection>
                </Charts:Series>
            </Charts:FunnelChart.Series>
        </Charts:FunnelChart>
    </Grid>
</Page>
```

Run the project. The following image illustrates the resulting chart at runtime.

Concepts

Topics in this section:

- Data Points, Series and Series Views
- Data Scale Types
- Providing Data

© 2018 Developer Express Inc.

Data Points, Series and Series Views

Windows 10 App Controls > Controls > Charts > Concepts > Data Points, Series and Series Views

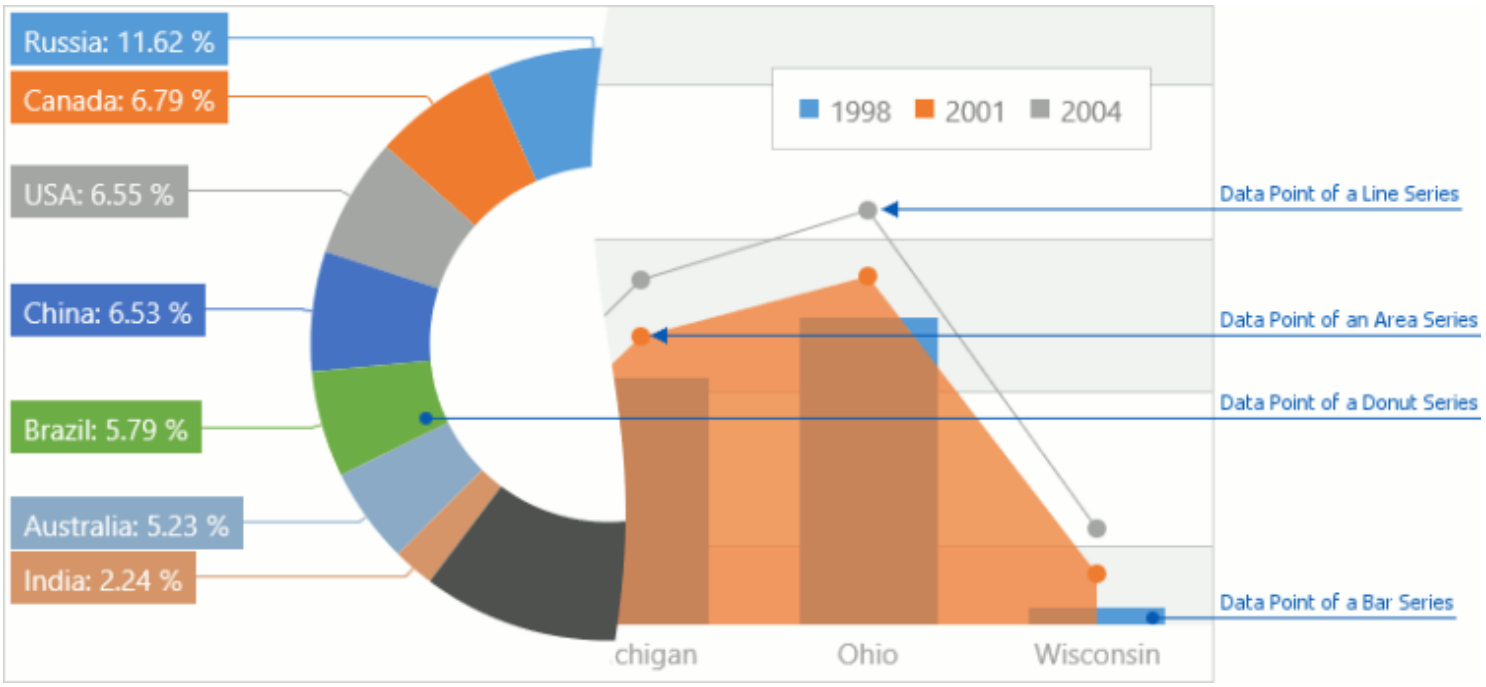
This document provides general information about the *data point*. It explains its argument and value(s), and also provides an overview of *series* and available view types.

Data Points

A chart's most fundamental element is the *data point*. A group of data points represents a single *series*.

No series is displayed until it has at least one data point specified, and points can be specified using the Series.Data property. For more information, refer to Providing Data.

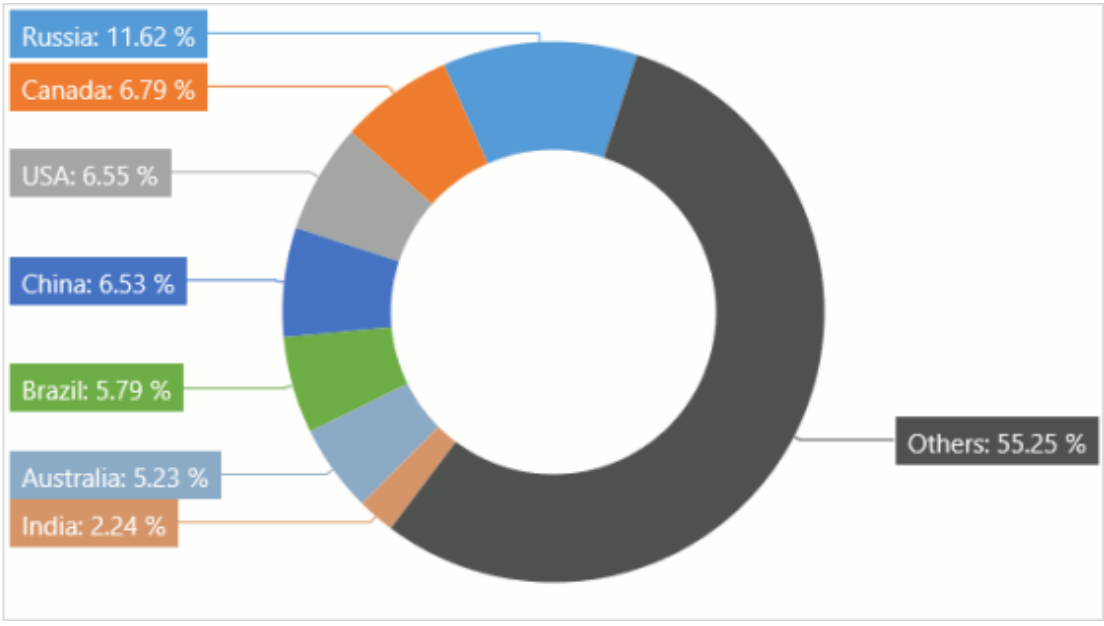
Because charts support numerous series *view types*, which represent and organize data in different ways, visual representation of a data point differs from one view to another.



Each data point must have one *argument* and at least one corresponding *value*. In general, the pairing of an argument and its value is represented in a diagram's *axes* as their X and Y coordinates respectively, or have a slice proportional to the point value part in the series total value, as represented in the following image.

© 2018 Developer Express Inc.

Russia	17.0752
Canada	9.98467
USA	9.63142
China	9.59696
Brazil	8.51197
Australia	7.68685
India	3.28759
...	...

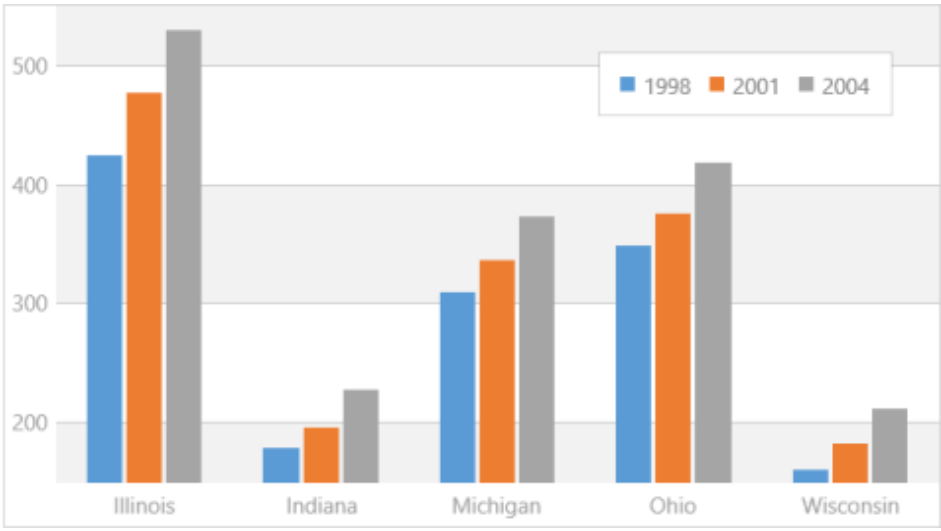


In a chart's Legend, it is possible to represent either a separate series, or individual points in the series. For details, refer to Legend.

Series and Series Views

A continuity of data points represents a *series*, which is not displayed until at least one point is specified. For example, the following image demonstrates three Bar series, and the underlying data they represent.

	1998	2001	2004
Illinois	423.721	476.851	528.904
Indiana	178.719	195.769	227.271
Michigan	308.845	335.793	372.576
Ohio	348.555	374.771	418.258
Wisconsin	160.274	182.373	211.727



Series reside in the ChartBase.Series collection. The chart is empty until there is at least one visible series in it. To learn about the ways in which series can be created, refer to Providing Data.

DevExpress Chart Controls for UWP support a number of different chart types. The *view type* determines both the series' specific image and the available set of options. For a list of available series view types, refer to Charts Gallery.

© 2018 Developer Express Inc.

Data Scale Types

Windows 10 App Controls > Controls > Charts > Concepts > Data Scale Types

This document briefly describes the specifics of data scale types in DevExpress Win10 App Chart Controls.

Each series should have an appropriate **scale type** defined for its data points' **arguments** and **values**. The scale type determines how a chart interprets the series' underlying data (as **qualitative**, **numeric** or **date-time**), which directly affects the chart's overall output.

You can define the scale type for a series in two ways:

- If you provide data for a series using the DataPointCollection object, set its DataPointCollection.ArgumentScaleType and DataPointCollection.ValueScaleType properties.
- If you provide data for a series using the DataSourceAdapter object, set the DataMember.ScaleType property values of its DataSourceAdapter.DataMembers.

Note that by default all scale type properties are set to ScaleType.Auto. This means that a chart tries to automatically determine the type of data by analyzing values provided for a chart. Thus, in general you do not need to specify the data scale type manually. However, if for some reason you want to use another scale type that differs from those that are automatically determined by a chart control, you can set custom values to the corresponding scale type properties.

© 2018 Developer Express Inc.

Providing Data

This document describes how to provide data for a chart, and lists two examples illustrating these approaches.

Overview

To provide data for a Series, it is necessary to specify one of the ChartDataAdapter class descendants to the Series.Data property. There are two ways of doing this:

- **Explicitly add all data points to the series**.
  To do this, assign the DataPointCollection object to the **Series.Data** property and add all data points to the DataPointCollection.Points collection.
- **Populate a series with data from a datasource**.
  To do this, assign the DataSourceAdapter object to the **Series.Data** property and specify its settings, such as DataSourceAdapter.DataSource and DataSourceAdapter.DataMembers.

Example: Using DataPointCollection

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4239.

The following example demonstrates how to create a simple Pie Chart with one series.

Xaml

```
 (MainPage.xaml)
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:PieChart"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="PieChart.MainPage"
    mc:Ignorable="d">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Charts:PieChart Margin="50" ToolTipEnabled="True">
            <Charts:Series>
                <Charts:Series.View>
                    <Charts:PieSeriesView LegendPointPattern="{}{A}"/>
                </Charts:Series.View>
                <Charts:Series.Data>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint Argument="USA" Value="9.63142" />
                        <Charts:DataPoint Argument="Canada" Value="9.98467" />
                        <Charts:DataPoint Argument="Russia" Value="17.0752" />
                        <Charts:DataPoint Argument="Others" Value="81.2" />
                        <Charts:DataPoint Argument="India" Value="3.28759" />
                        <Charts:DataPoint Argument="Australia" Value="7.68685" />
                        <Charts:DataPoint Argument="Brazil" Value="8.511965" />
                        <Charts:DataPoint Argument="China" Value="9.59696" />
                    </Charts:DataPointCollection>
                </Charts:Series.Data>
            </Charts:Series>
            <Charts:PieChart.Legend>
                <Charts:Legend MaximumRowsOrColumns="4"/>
            </Charts:PieChart.Legend>
        </Charts:PieChart>
    </Grid>
</Page>
```

Example: Using DataSourceAdapter

© 2018 Developer Express Inc.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }

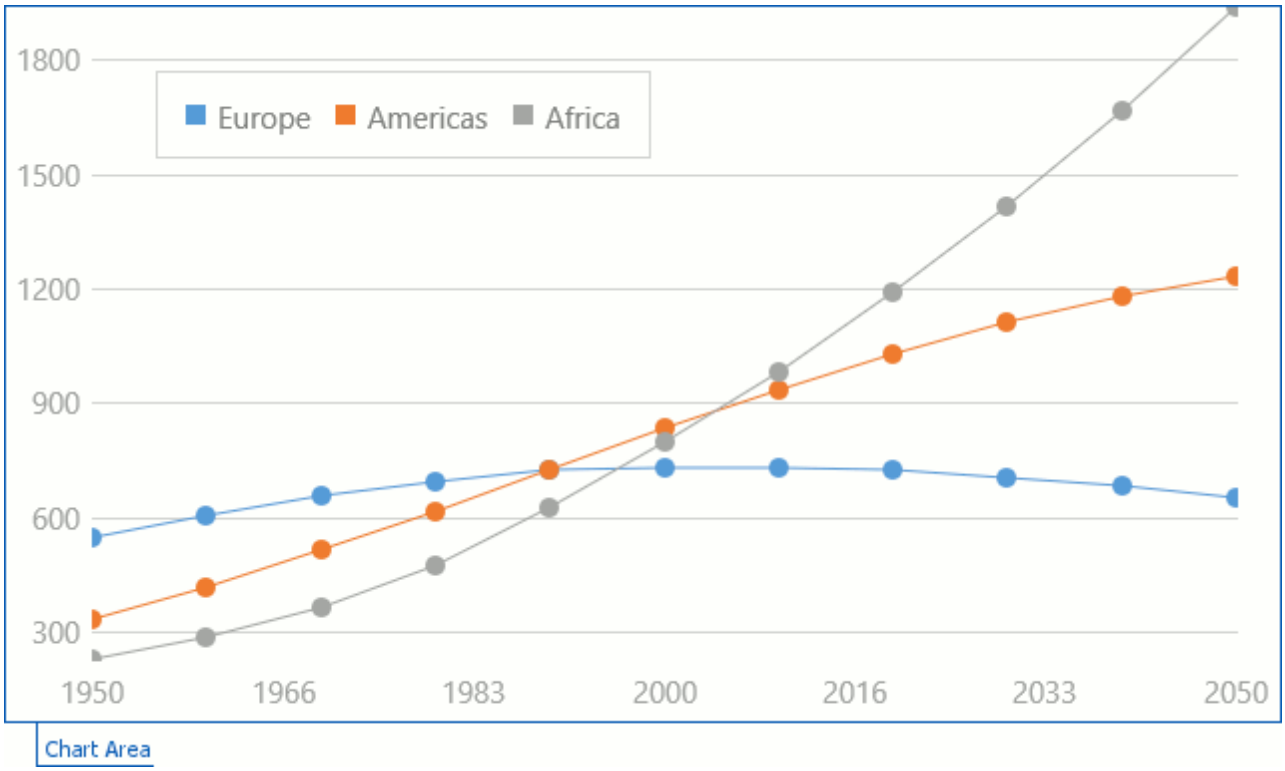
Chart Area

Windows 10 App Controls > Controls > Charts > Visual Elements > Chart Area

The **Chart Area** of a chart control is represented by a rectangle, which holds all of the separate chart elements (e.g., the legend) that relate to this chart control.

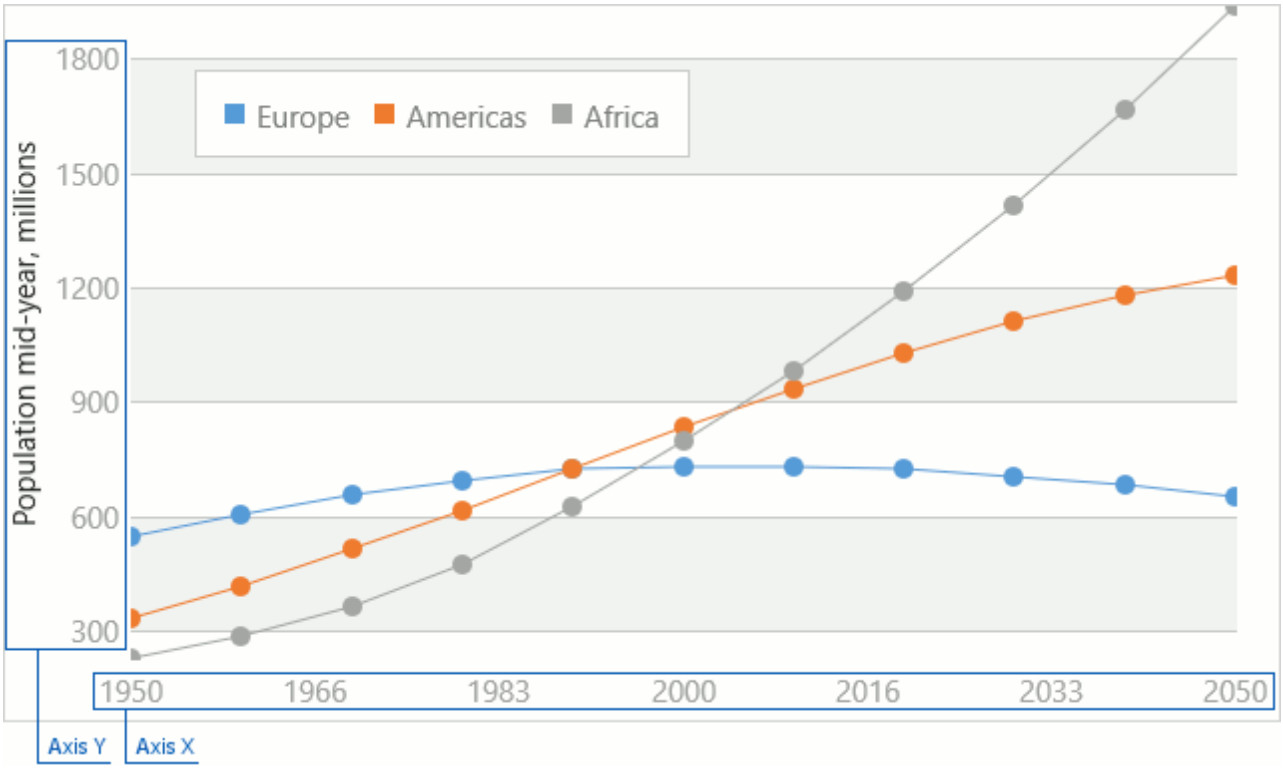


© 2018 Developer Express Inc.

Axis

Windows 10 App Controls > Controls > Charts > Visual Elements > Axis

An **Axis** provides end-users with a visual means for reading and analyzing the data displayed within the chart area. Most charts contain two axes: a numerical axis of values (the Y-axis) and an axis of arguments (the X-axis).



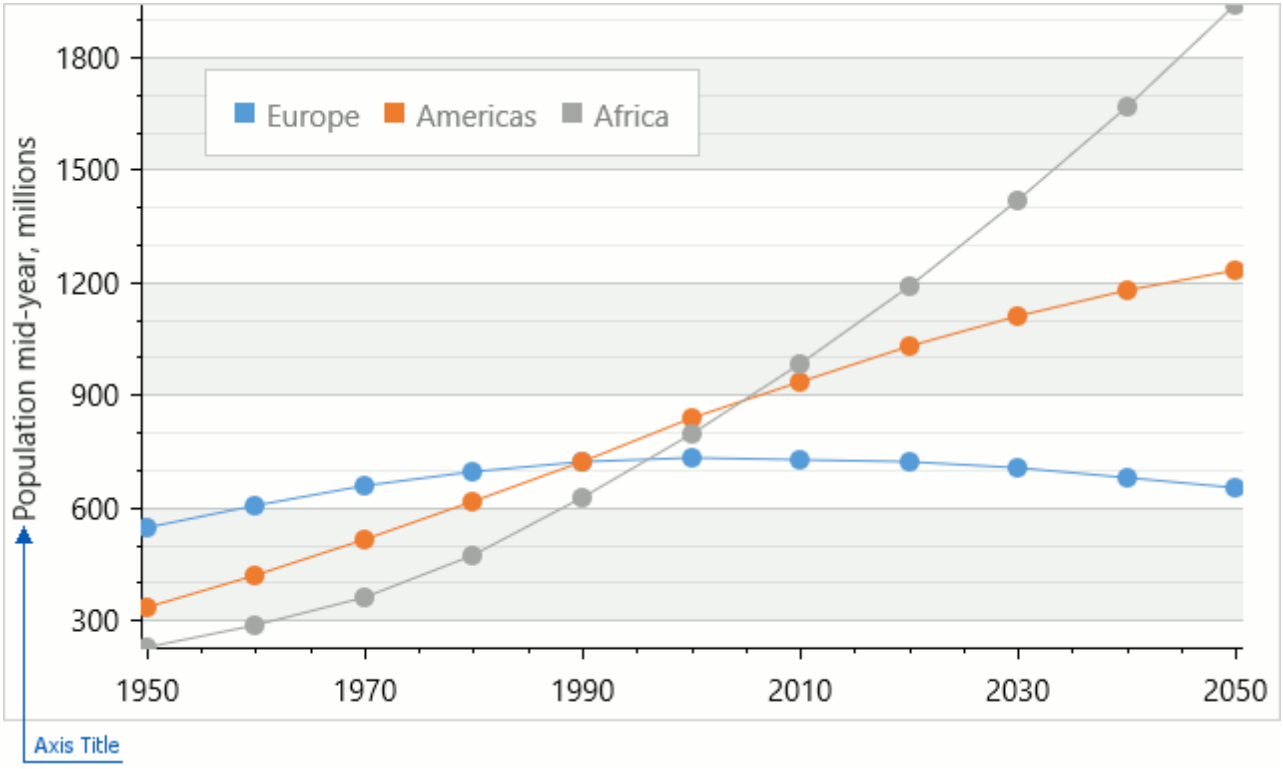
An axis allows you to access and customize the following chart elements:

- Axis Gridlines;
- Axis Tickmarks;
- Axis Labels;
- Strips.

© 2018 Developer Express Inc.

Axis Title

The **Axis Title** can be used to display explanatory text for the data measured by the corresponding axis.

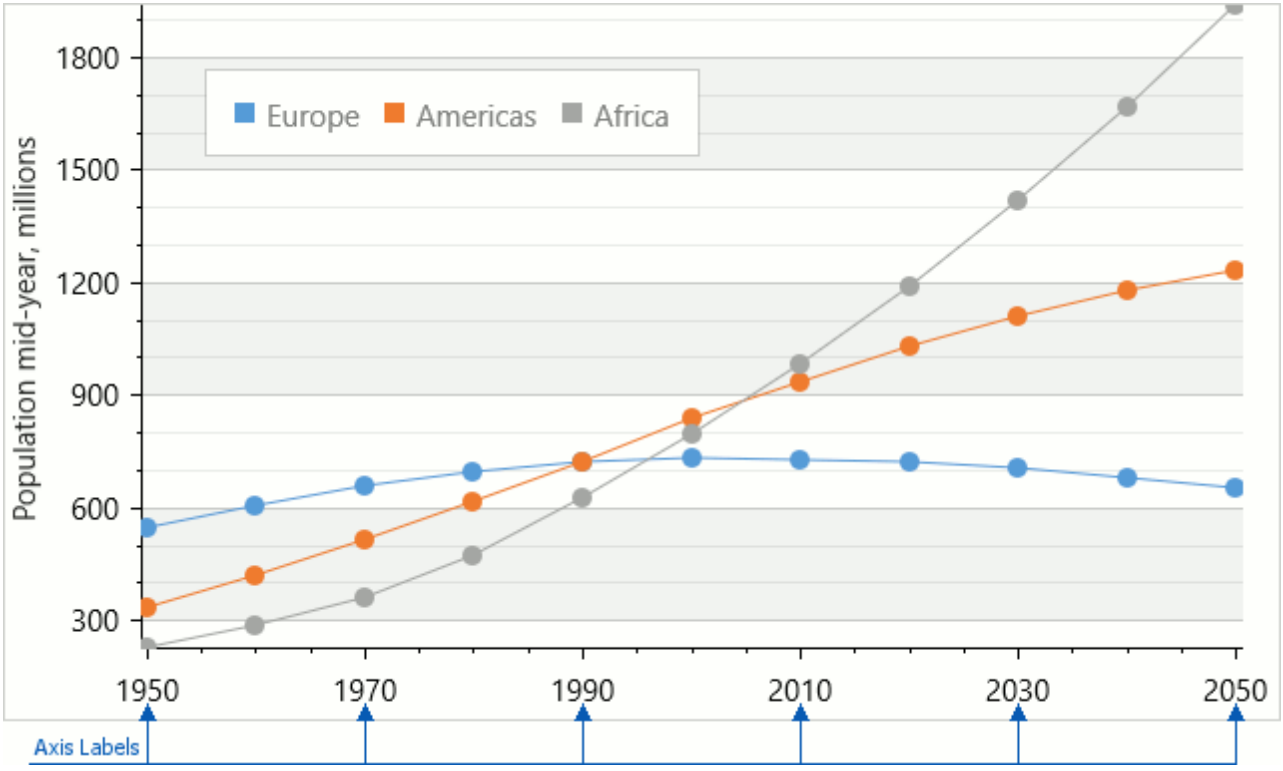


© 2018 Developer Express Inc.

Axis Labels

Windows 10 App Controls > Controls > Charts > Visual Elements > Axis Labels

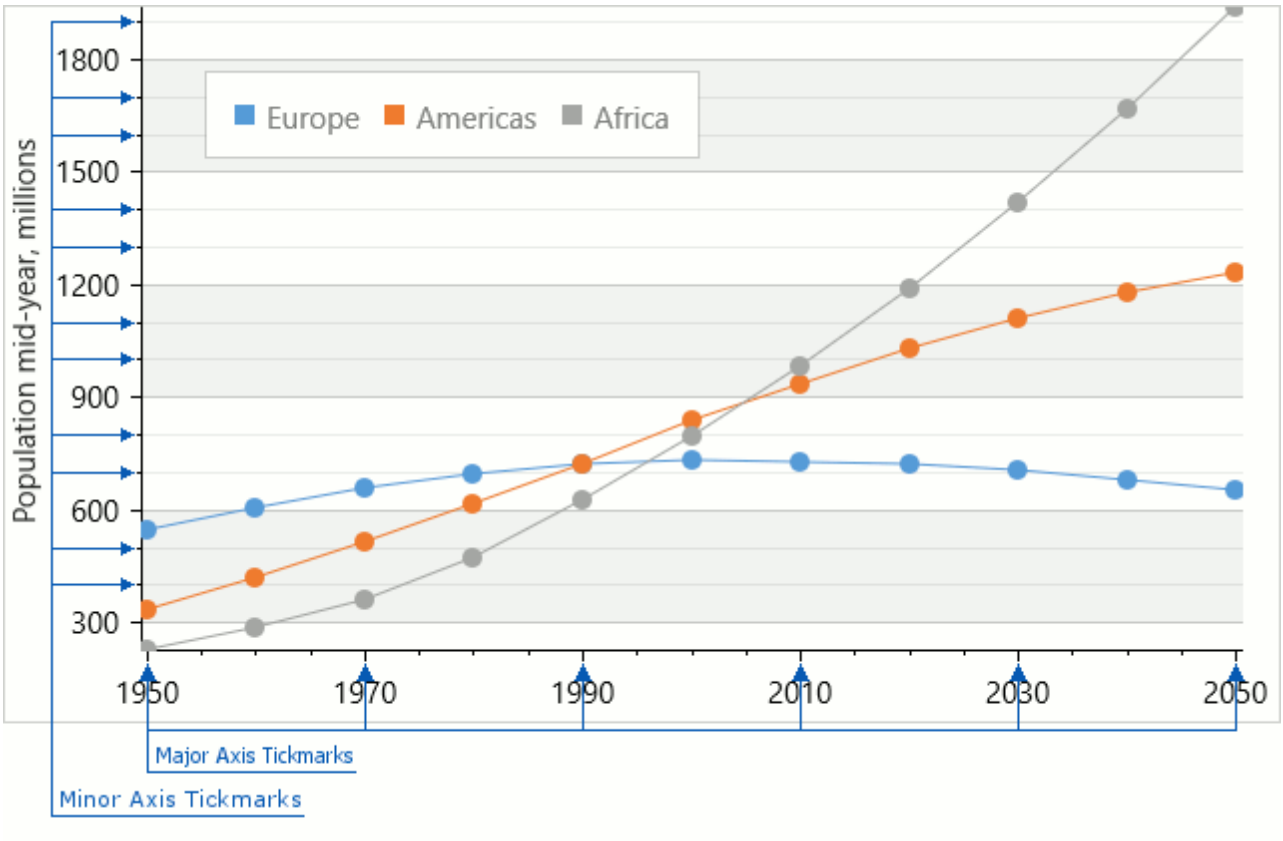
Axis Labels are generated automatically based upon the axis scale and displayed along the axis.



© 2018 Developer Express Inc.

Axis Tickmarks

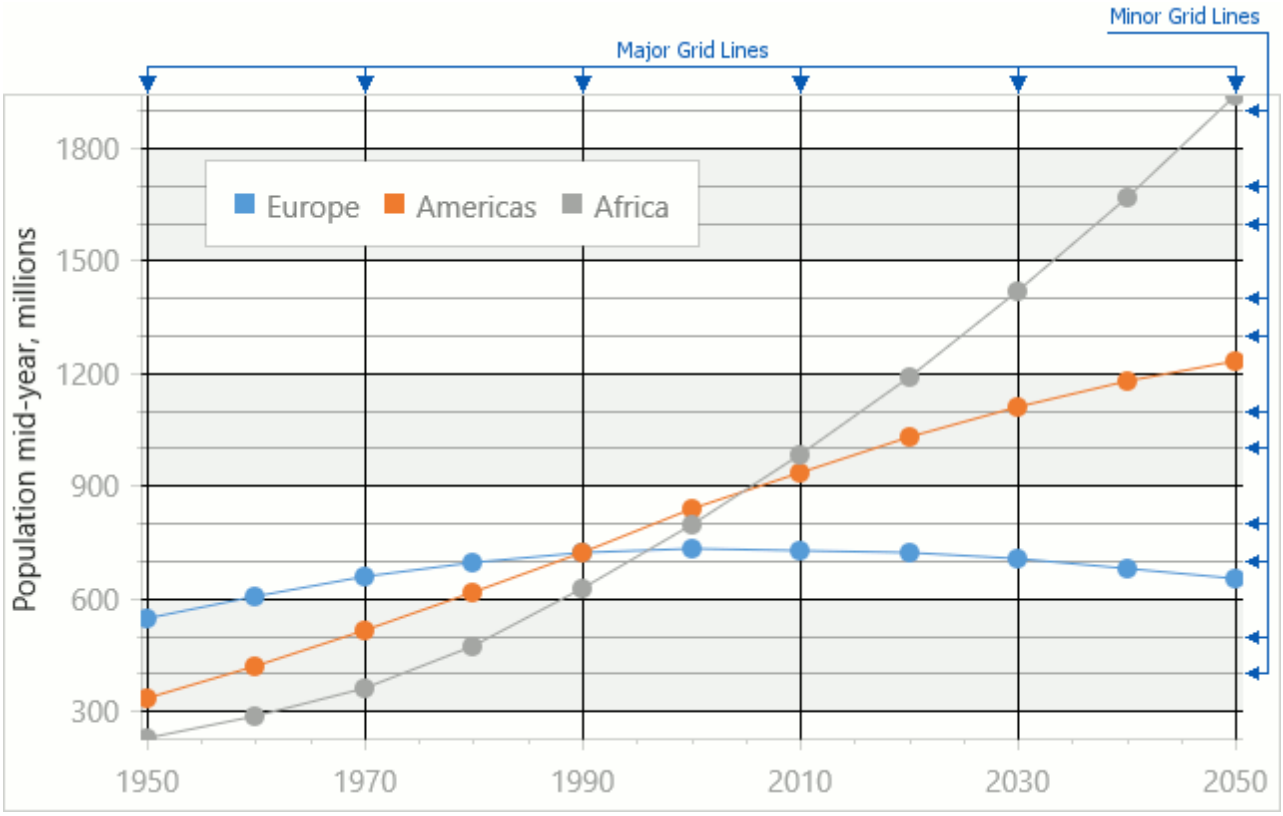
Tickmarks divide an axis into equal sections by a step whose value is determined by the special options of an axis. Tickmarks are used to make the data within a chart clearer, and more readable. In addition, axis labels may accompany them. There are two types of tickmarks: *major* and *minor*.



© 2018 Developer Express Inc.

Axis Gridlines

An axis can display **Grid Lines** to improve the readability of the displayed charts for an end-user. There are two types of grid lines: *major* and *minor*.

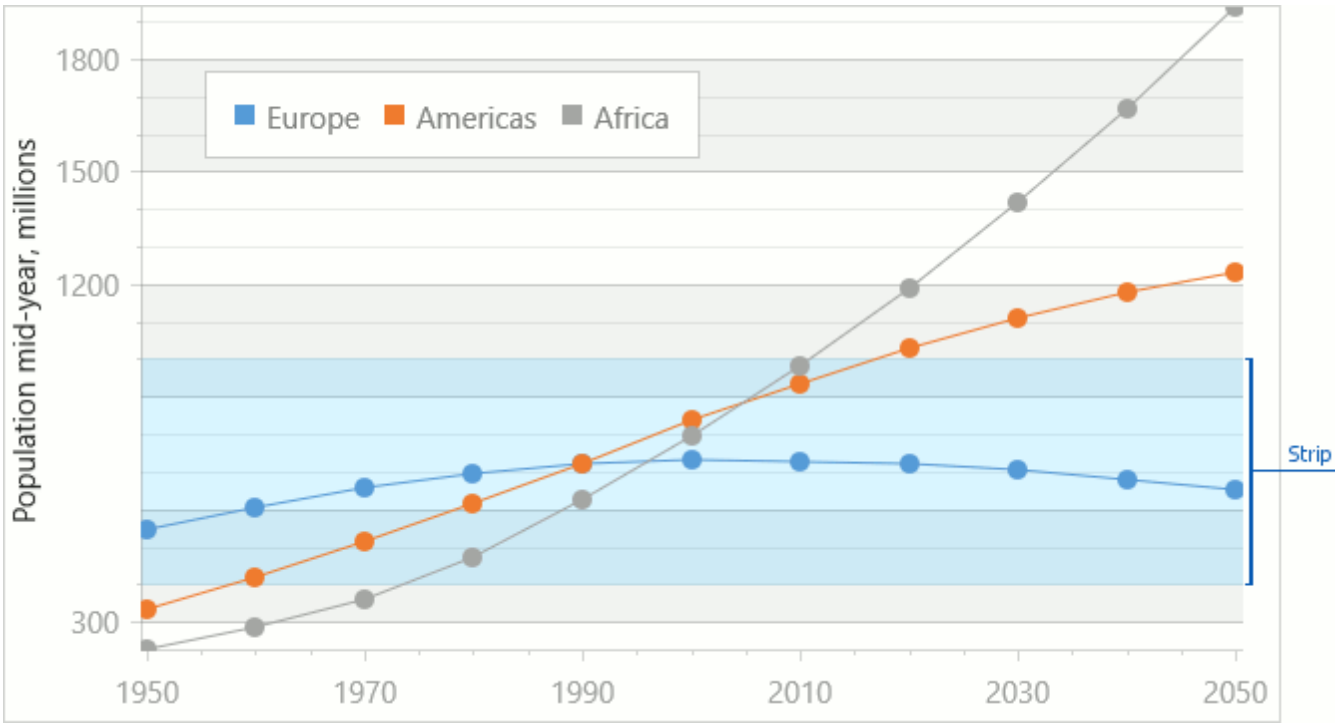


© 2018 Developer Express Inc.

Strip

Windows 10 App Controls > Controls > Charts > Visual Elements > Strip

Strips are the highlighted areas in a chart area, within the defined range of values (minimum and maximum) of an axis to which they belong. In general, strips are used to visually represent a range of values behind a series, and trace whether the series points' values fall in or out of that range. End-users can quickly and easily identify data that falls within a given range when strip lines are implemented.

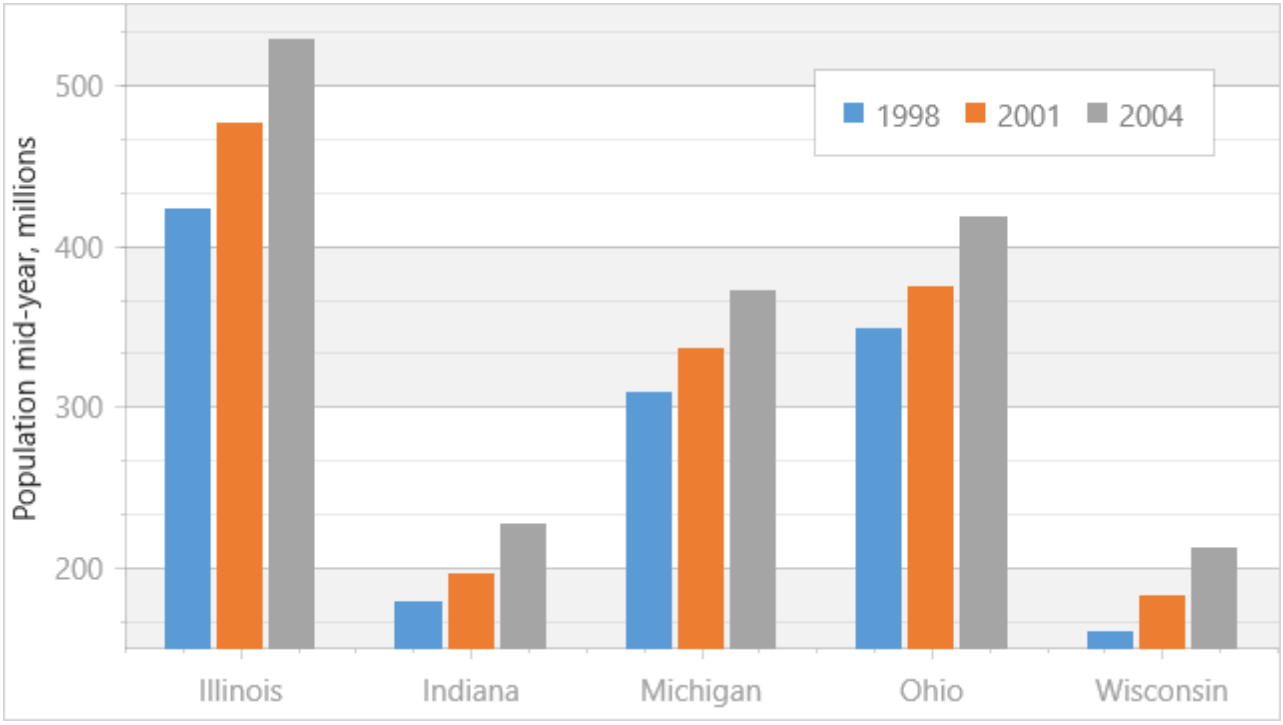


© 2018 Developer Express Inc.

Series

Windows 10 App Controls > Controls > Charts > Visual Elements > Series

A **Series** represents a group of related data points plotted onto a chart control's area.



A series also allows you to access and customize the visual elements of data points, including data point labels and data point markers.

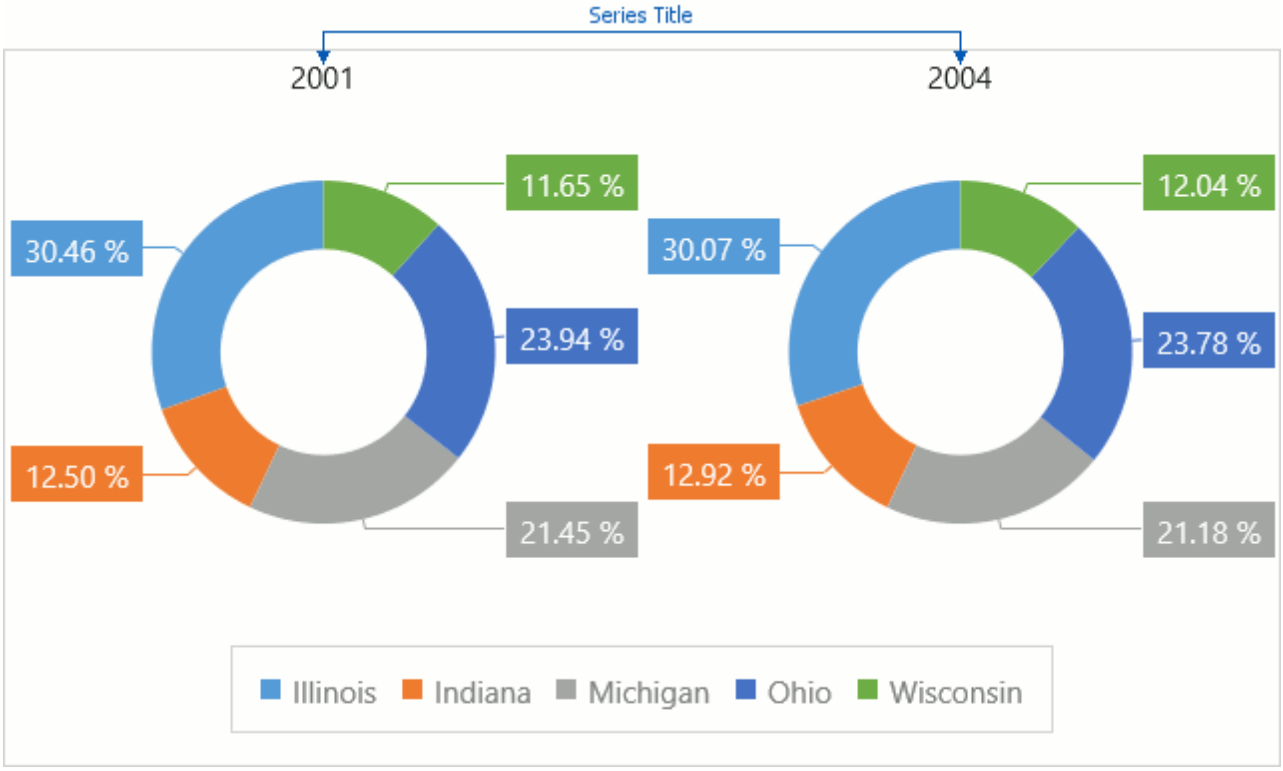
© 2018 Developer Express Inc.

Series Title

Windows 10 App Controls > Controls > Charts > Visual Elements > Series Title

A series title allows you to specify the title content. The title can be accompanied by explanatory titles if you select the Pie or Donut view type.

The following chart illustrates two Donut series accompanied by series titles (2000 and 2004).

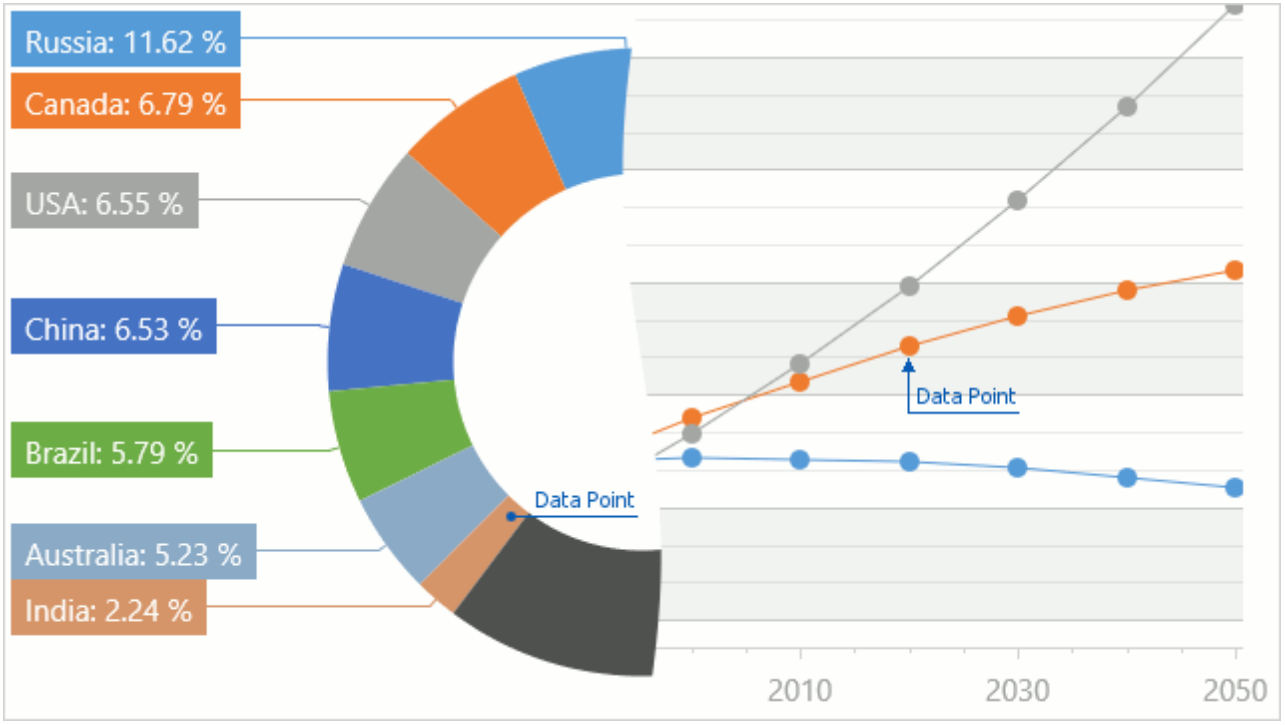


© 2018 Developer Express Inc.

Data Points

Windows 10 App Controls > Controls > Charts > Visual Elements > Data Points

A **Series Data Point** represents an individual data point within a series. Each data point is plotted on the chart area, based upon one X value (the point's argument) and one or more Y values (the value(s) of the data point). Depending on the view type of the series that owns the point, the point can be represented within the chart with the help of different chart elements (such as a bar, a data point marker or a pie slice) and can be identified using data point labels.

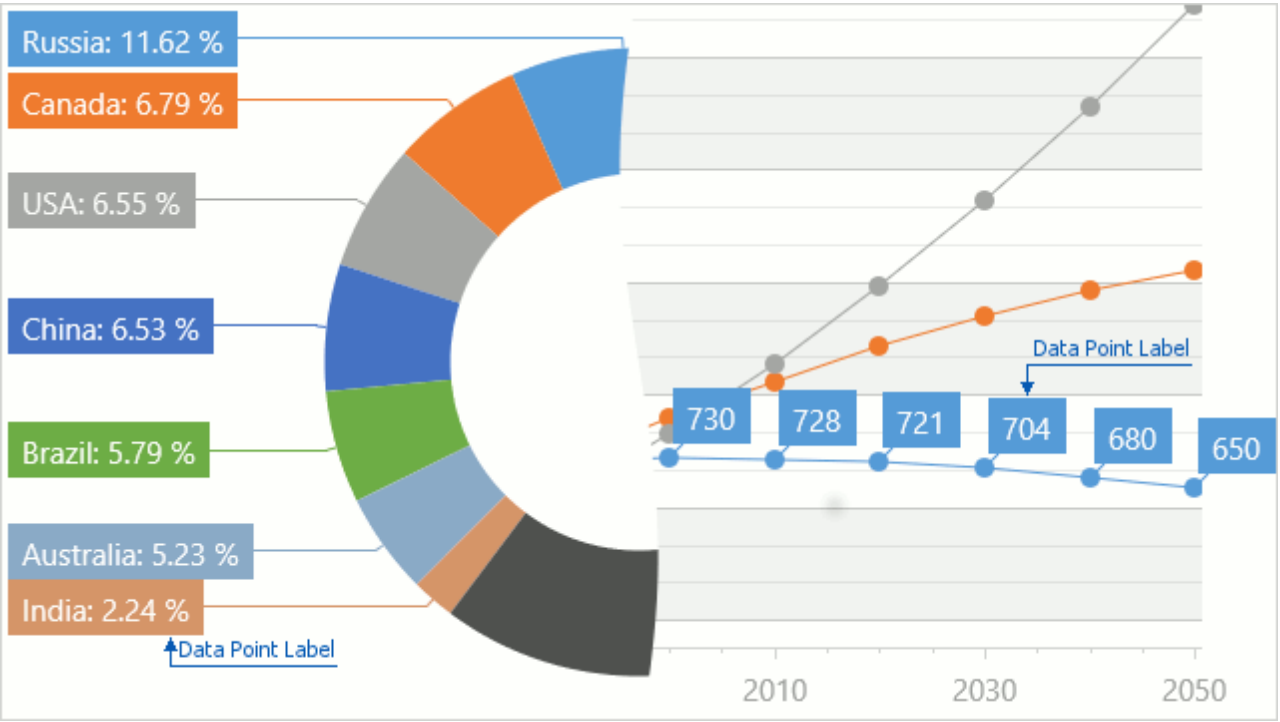


© 2018 Developer Express Inc.

Data Point Labels

Windows 10 App Controls > Controls > Charts > Visual Elements > Data Point Labels

Series Point Labels (or **Series Labels**) are used to identify specific data points within a series. These labels are displayed inside plotting areas, next to a data point. Centralized customization of series labels is performed at the series level.

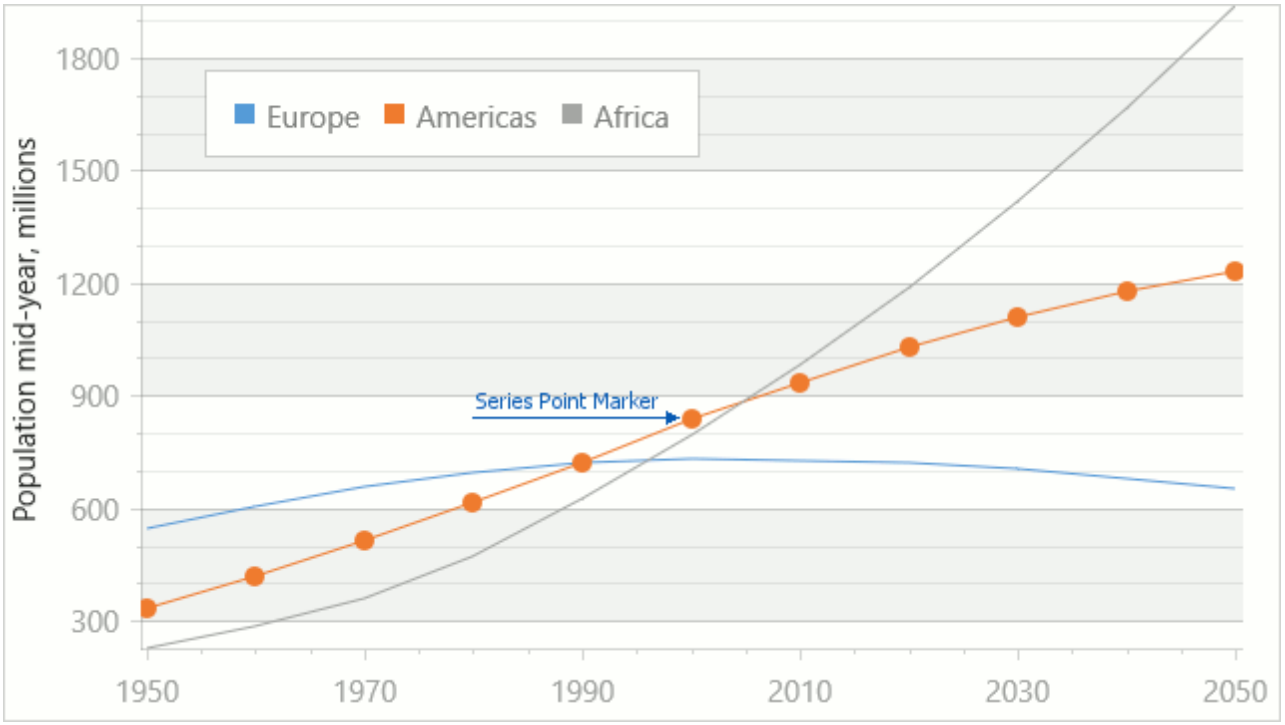


© 2018 Developer Express Inc.

Data Point Markers

Windows 10 App Controls > Controls > Charts > Visual Elements > Data Point Markers

Data Point Markers are displayed within Point, Line and other series, and are used to indicate individual data points on the chart area.

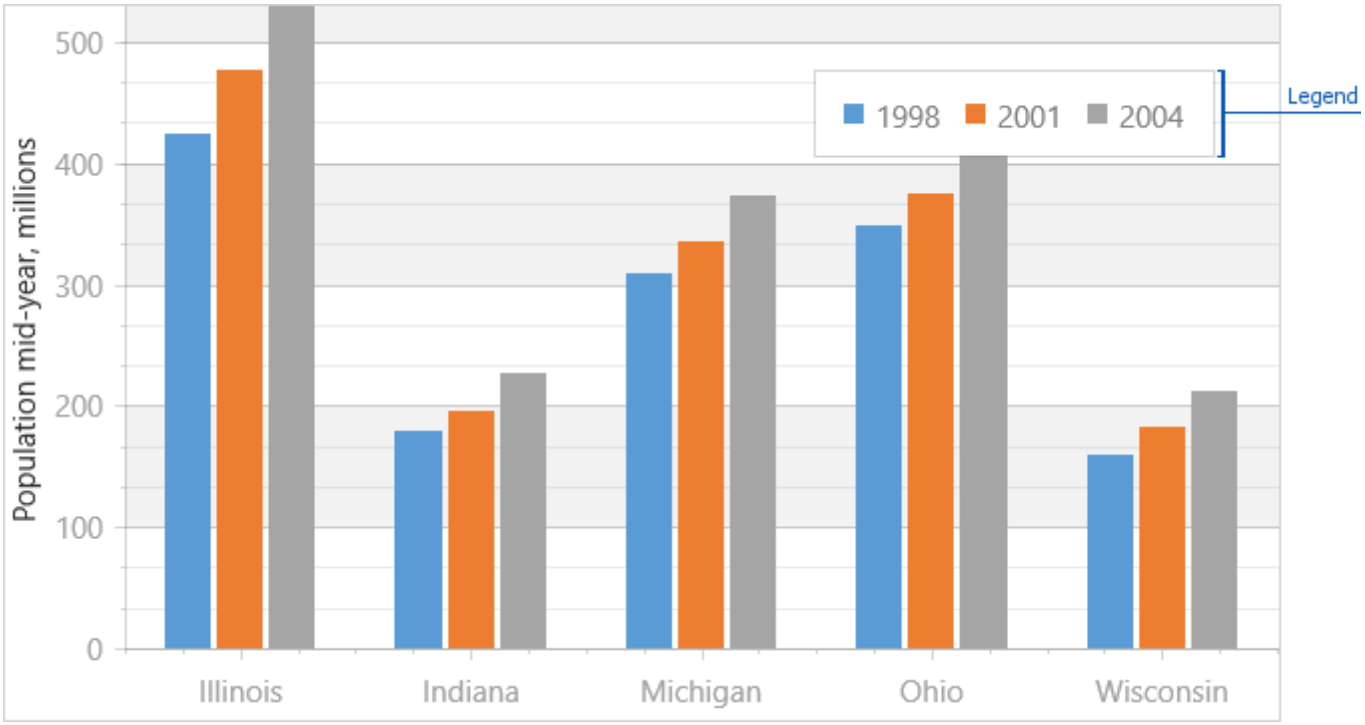


© 2018 Developer Express Inc.

Legend

Windows 10 App Controls > Controls > Charts > Visual Elements > Legend

The **Legend** can be used to help end-users identify different chart elements such as series and data points. Each legend entry can be displayed using its corresponding legend marker and text identifying the entry.



© 2018 Developer Express Inc.

Legend Markers

Windows 10 App Controls > Controls > Charts > Visual Elements > Legend Markers

Legend Markers can be displayed within the legend to help end-users visually identify different chart elements, such as the series and data points indicated by the legend. The content of each legend marker depends upon the type of the corresponding chart element.

How to: Use the CartesianChart

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.	

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

How to: Bind a Chart to Data

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(C
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, Po
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;
                points.Add(new DateTimeDataPoint() { PointArgument = start
            }
            return points;
        }
        protected double GenerateStartValue(Random random) {
            return Start + random.NextDouble() * 100;
        }
        protected double GenerateAddition(Random random) {
            double factor = random.NextDouble();
            if (factor == 1)
                factor = 50;
            else if (factor == 0)
                factor = -50;
            return (factor - 0.5) * 50;
        }
    }
}

Overview

Windows 10 App Controls > Controls > Map Control > Overview

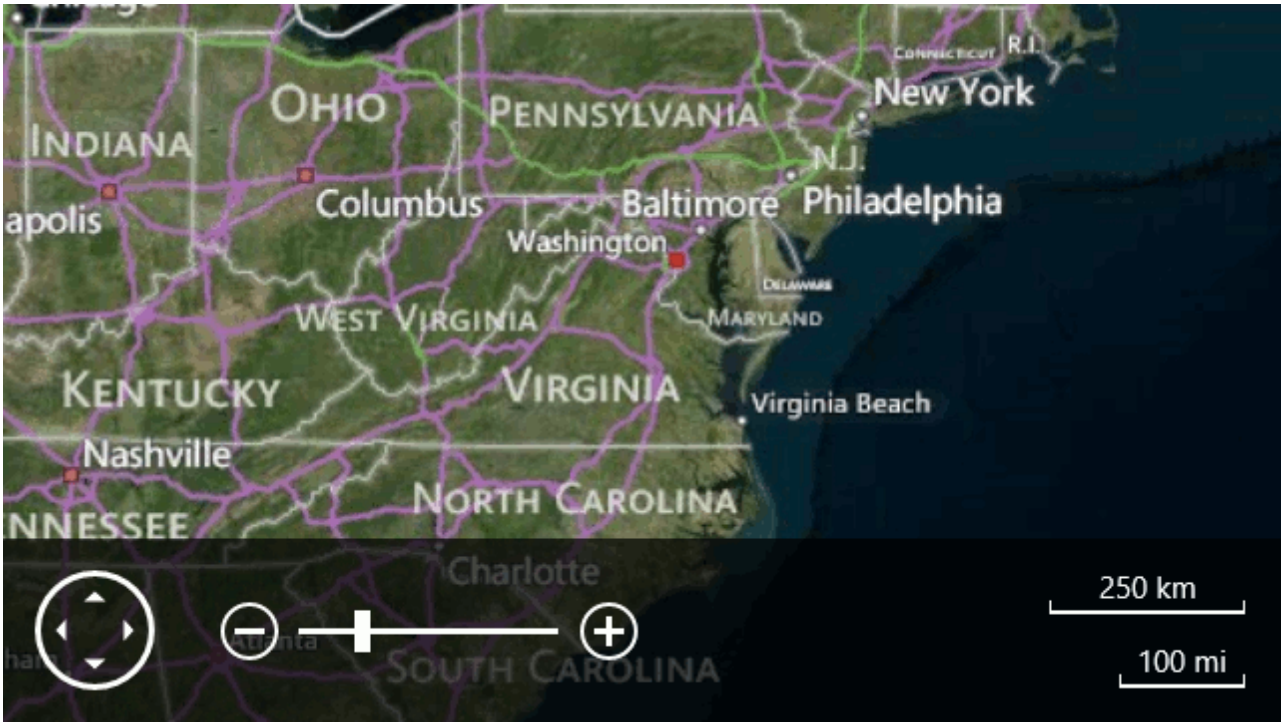
This suite contains the MapControl, which is intended to display raster and vector maps in Universal Windows applications.

The Map Control provides the following features.

Image Tiles Providers

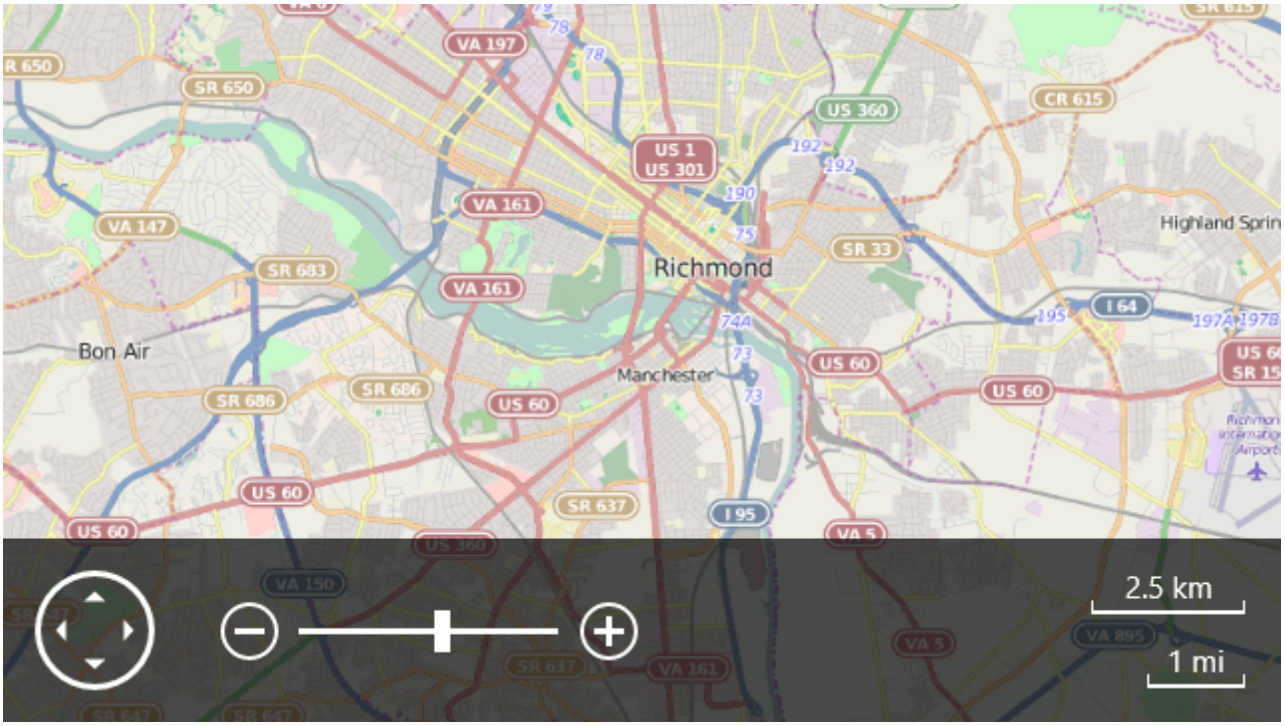
The DevExpress MapControl ships with support for two data providers: Bing Maps and OpenStreetMap.

- Bing Maps example:



- OpenStreetMap example:

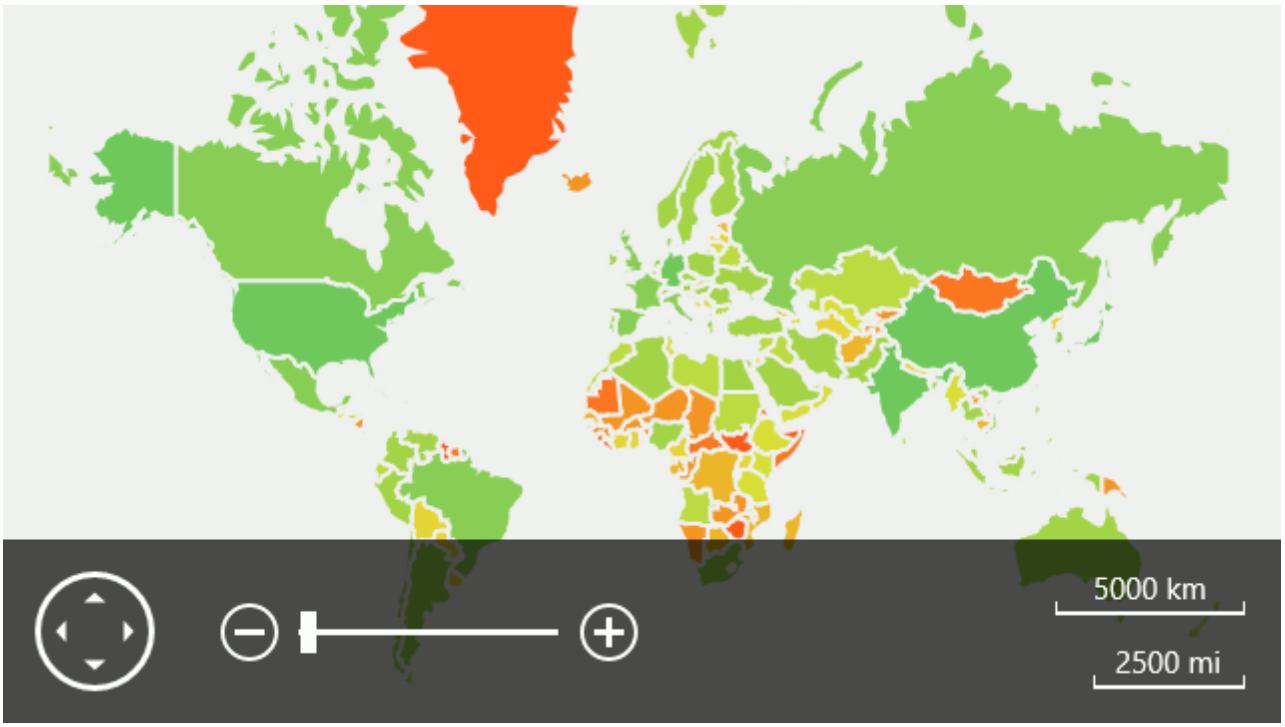
© 2018 Developer Express Inc.



Support for Vector Formats

- **Shapefile**

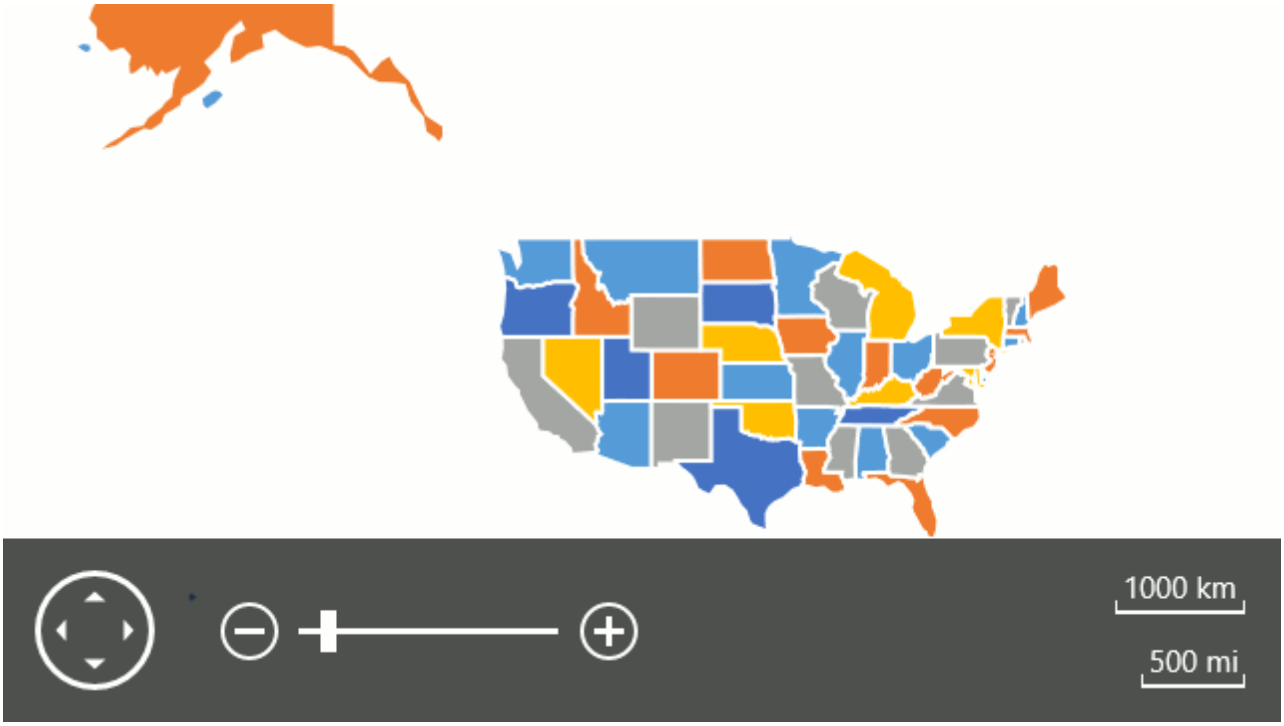
The DevExpress MapControl provides support for the Shapefile format. Note that our map control is capable of loading both shape contours and supplementary information from shapefiles. With this capability, you can, for example, display map regions painted in different colors (for more information, refer to the Colorizers topic).



- **KML**

In addition, the MapControl supports KML file format.

© 2018 Developer Express Inc.



Vector Layer Features

The DevExpress MapControl ships with the following built-in vector elements.

- Dot
- Ellipse
- Line
- Polygon
- Polyline
- Path
- Rectangle
- Pushpin
- Custom Element

Lesson 1 - Connect to the Image Tiles Provider

This is the first tutorial of the Map Control Getting Started series. It will guide you through the process of creating a simple map application that connects to the Bing Maps data provider.

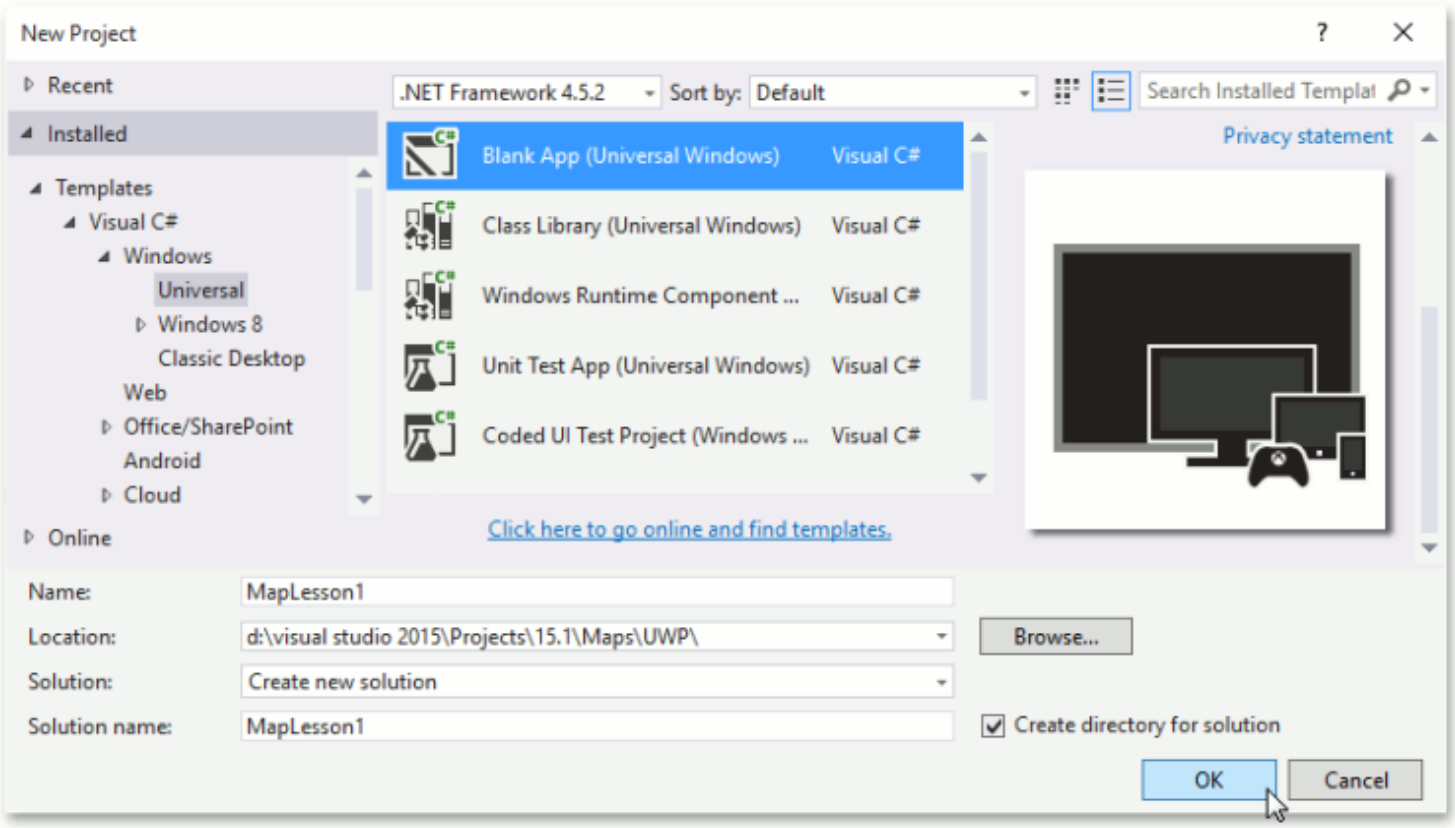
This tutorial consists of the following steps.

- Step 1. Add a Map Control
- Step 2. Connect to an Image Tiles Provider
- Step 3. Customize the Image Tiles Provider
- Step 4. Customize Map Appearance
- Result

Step 1. Add a Map Control

In this step, we will perform the common actions that are required when you add a Map control to your application.

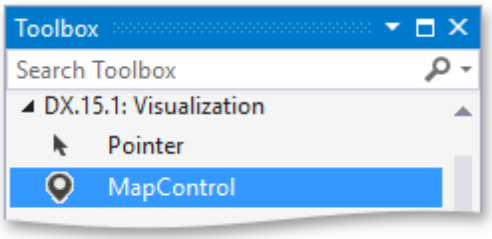
- Run MS Visual Studio 2015 or 2017.
- Create a new **Universal | Blank App (Universal Windows)** project.



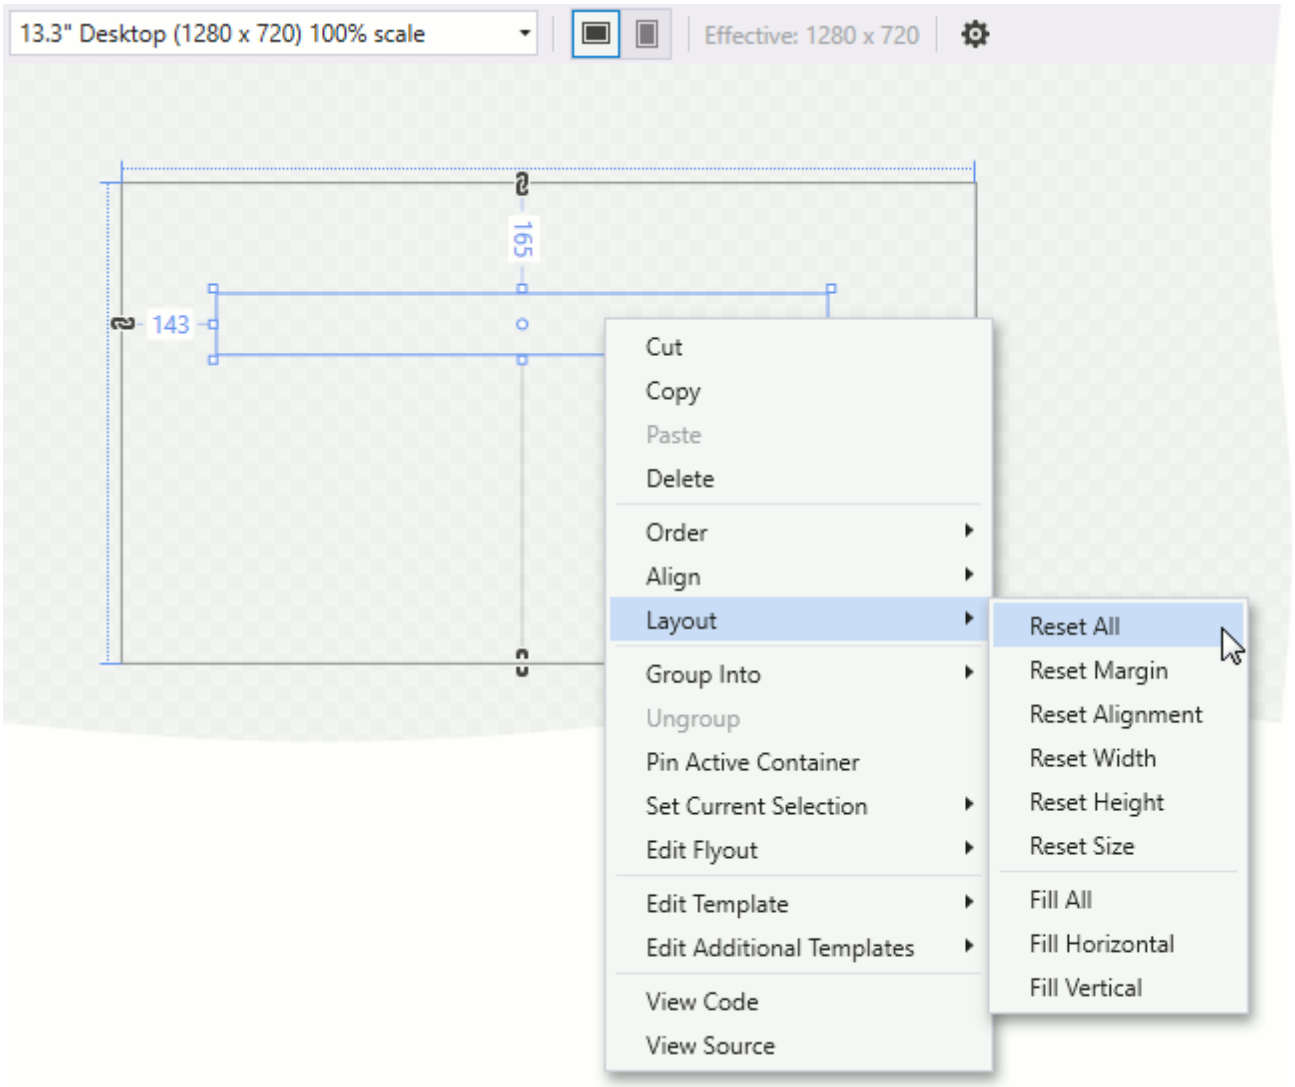
- Add the MapControl component to your project.

To do this, locate the **MapControl** item in a Visual Studio toolbox on the **DX. 18.1: Visualization** tab and drop it onto the main window.

© 2018 Developer Express Inc.



- Right-click the MapControl object and choose the **Layout | Reset All** option in the context menu. This will stretch the Map control to fill the whole window.



After performing these actions the XAML should look as follows.

Xaml	

© 2018 Developer Express Inc.

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:MapControl_Lesson1"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Map="using:DevExpress.UI.Xaml.Map"
    x:Class="MapControl_Lesson1.MainPage"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl/>
    </Grid>
</Page>
```

Step 2. Connect to an Image Tiles Provider

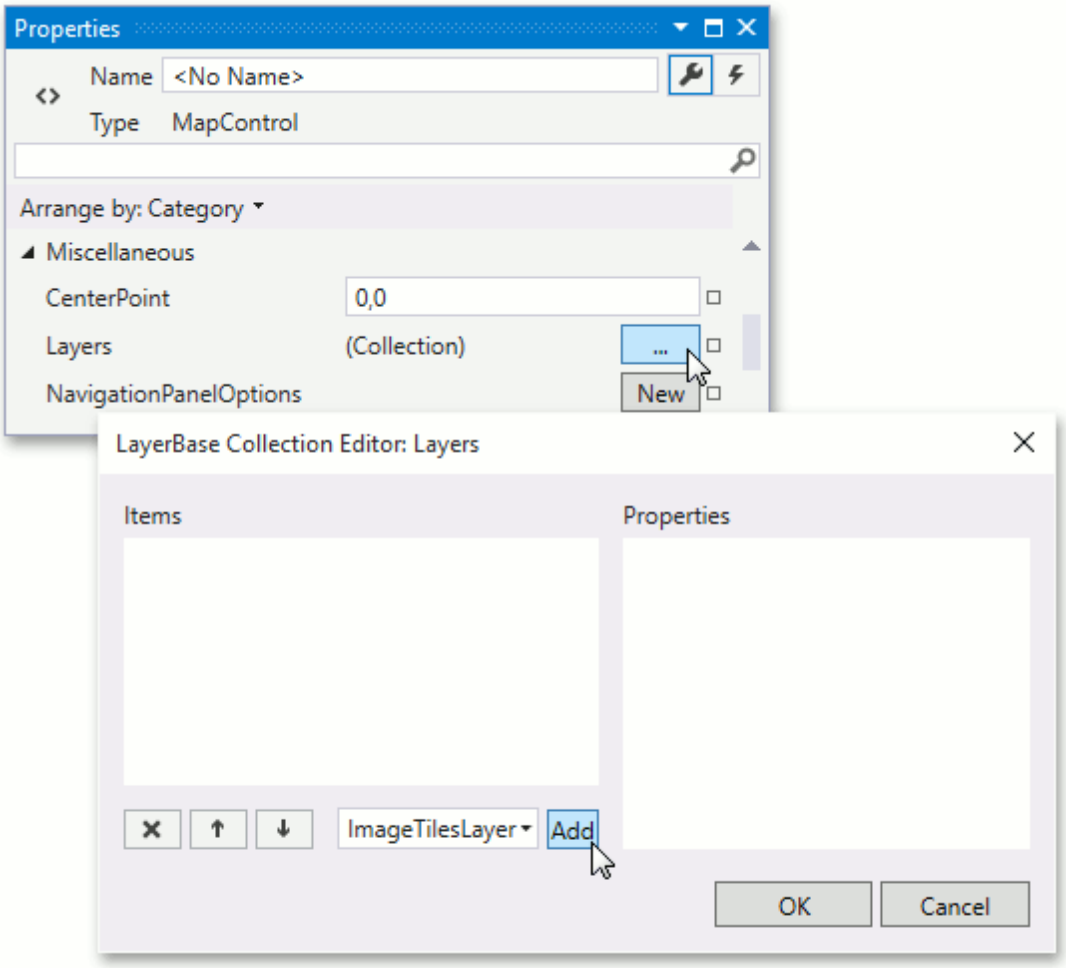
The Map control can display multiple layers to draw image tiles or vector elements. To load images from a specific image tiles provider, use the ImageTilesLayer object.

In this lesson, the Bing Maps image tiles provider is used. To load image tiles from the Bing Maps provider, do the following.

Note

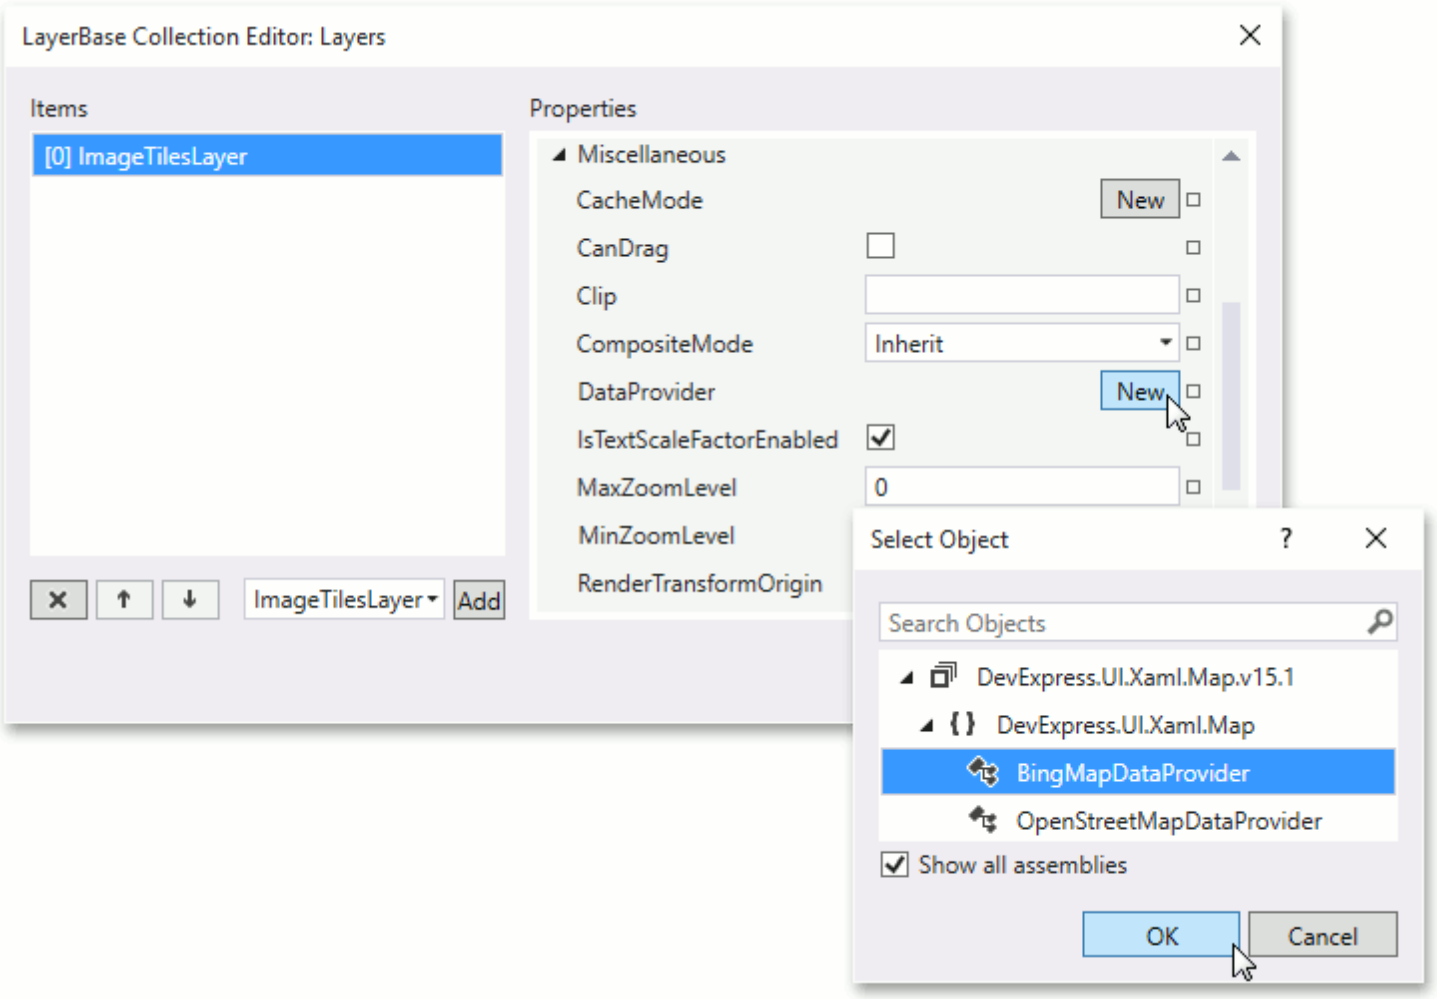
Also, it is possible to use the OpenStreetMap image tiles provider (to learn more, refer to the How to: Use the OpenStreetMapDataProvider topic) or load image tiles from another source.

- Locate the MapControl.Layers property in the **Properties** window and click the ellipsis button to invoke the Layers collection editor. In the invoked **LayerBase Collection Editor**, choose the ImageTilesLayer type and click **Add**.



- For the newly created layer, choose the ImageTilesLayer.DataProvider property and set it to BingMapDataProvider.

© 2018 Developer Express Inc.



Now your current XAML should look like this.

Xaml

```
<!-- -->
<Map:MapControl>
    <Map:ImageTilesLayer>
        <Map:ImageTilesLayer.DataProvider>
            <Map:BingMapDataProvider/>
        </Map:ImageTilesLayer.DataProvider>
    </Map:ImageTilesLayer>
</Map:MapControl>
<!-- -->
```

Note

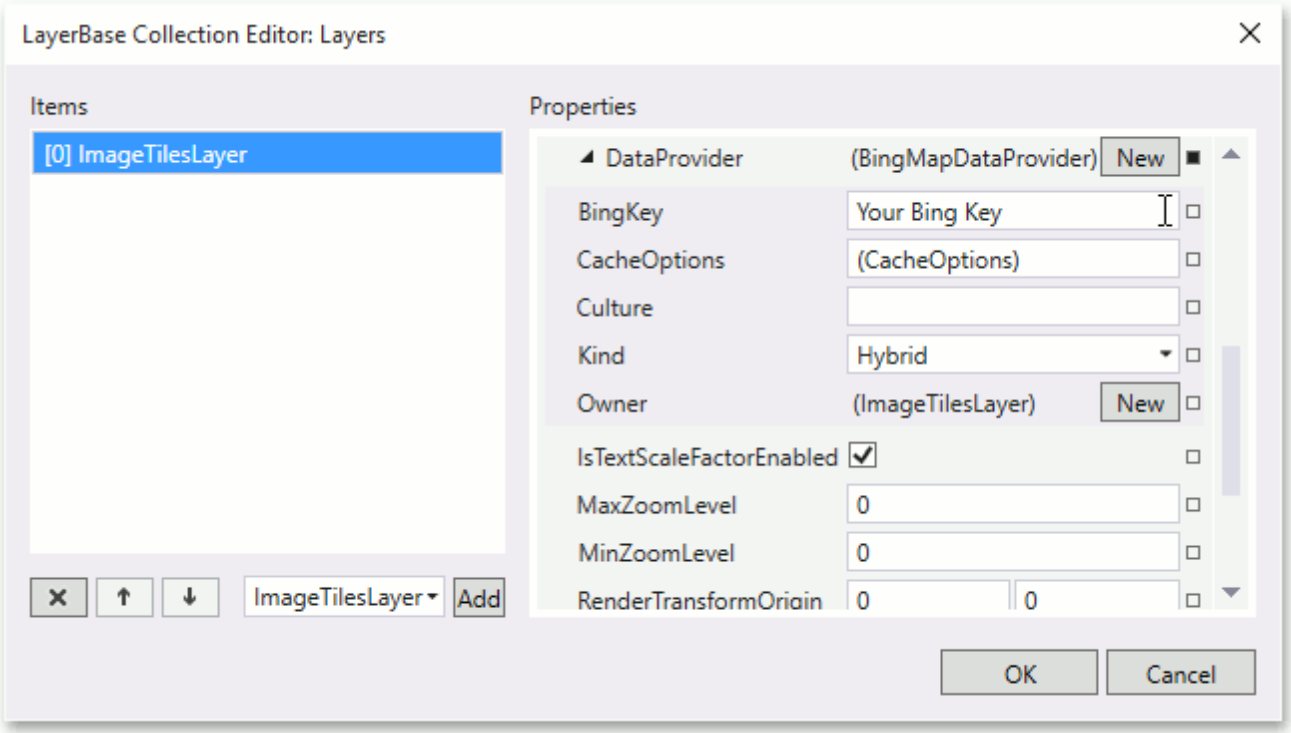
If you run the application and see a window with the following error message: *"Access was denied. You may have entered your credentials incorrectly, or you might not have access to the requested resource or operation."*, refer to the following tutorial: How to: Get a Bing Maps Key.

Step 3. Customize the Image Tiles Provider

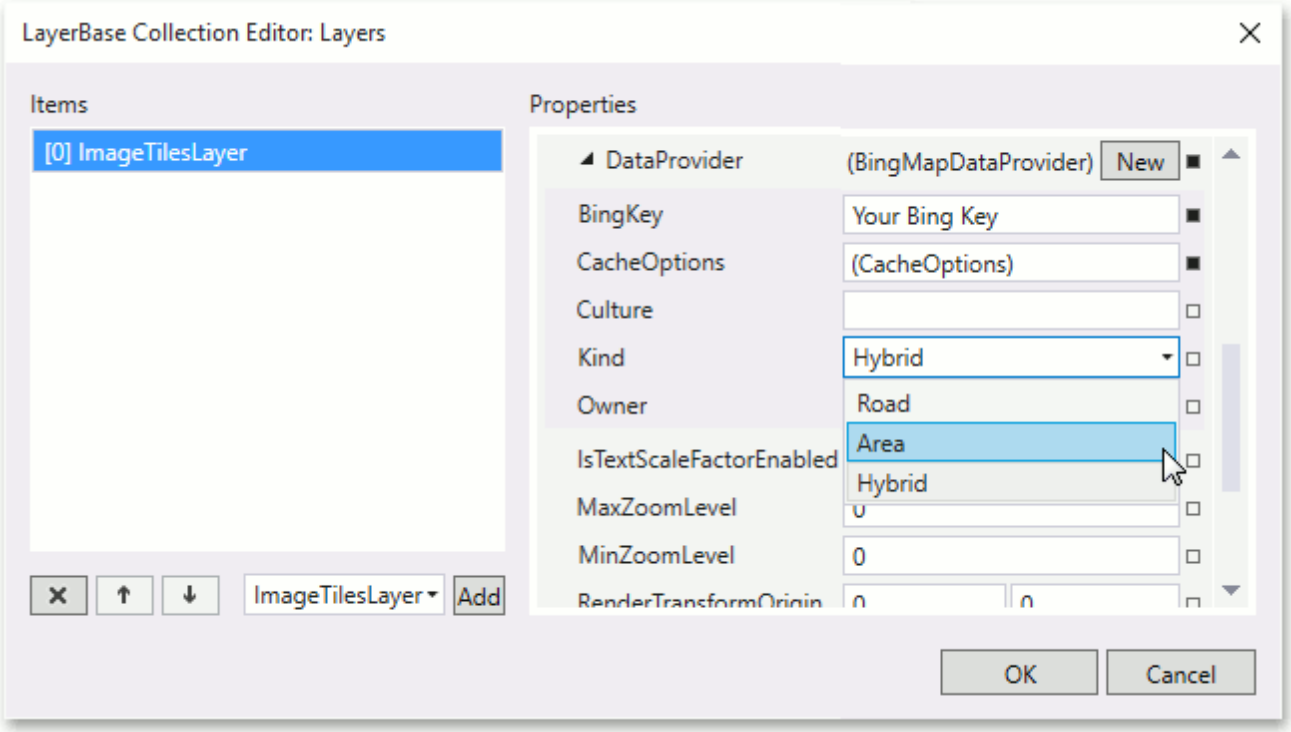
The BingMapDataProvider object should be configured before use. For this perform the following steps.

- Specify your valid Bing Maps key using the BingMapDataProvider.BingKey property. Because all Bing Maps transactions should be with valid Bing Maps key (for more detail refer to the Undestanding Bing Maps Transactions page).

© 2018 Developer Express Inc.



- The provider can show map images of three kinds: BingMapKind.Area, BingMapKind.Road and BingMapKind.Hybrid (by default). To change the current map kind, set the BingMapDataProvider.Kind property value to **Road**.



Then, click **OK** to close the window and apply changes.

In this step, your XAML should look like this.

Xaml	

© 2018 Developer Express Inc.

```
<!-- -->
<Map:ImageTilesLayer.DataProvider>
    <Map:BingMapDataProvider BingKey="Your Bing Key"
                             Kind="Road"/>
</Map:ImageTilesLayer.DataProvider>
<!-- -->
```

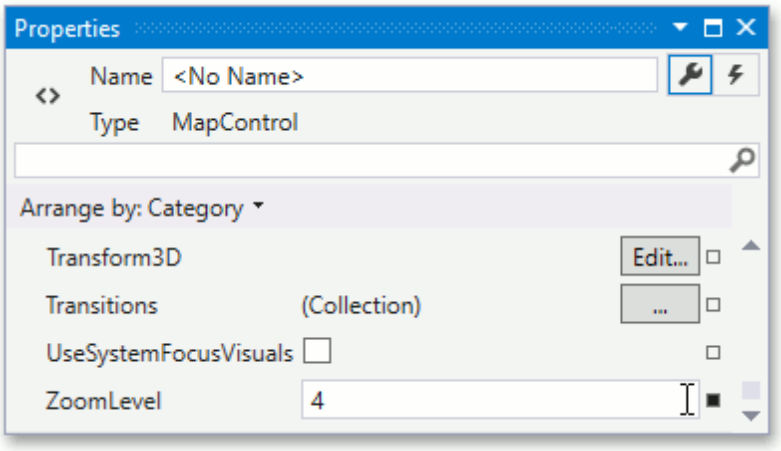
Step 4. Customize Map Appearance

During this step, you will learn how to customize additional map parameters.

- Sometimes it is necessary to show a particular area on a map. To do this, set the required value to the MapControl.CenterPoint property.

For example, set the MapControl.CenterPoint property value to **55, 25** to put European countries at the map's center.

- To specify the current zoom level for all map layers, use the MapControl.ZoomLevel property. For example, set its value to **4**.



Result

The following XAML should be produced as result.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279019.

Xaml

```
 (MainPage.xaml)
<Page xmlns:Map="using:DevExpress.UI.Xaml.Map"
    x:Class="MapLesson1.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml">
    <Grid
        Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl
            ZoomLevel="4">
            <Map:MapControl.CenterPoint>
                <Map:GeoPoint
                    Latitude="55"
                    Longitude="25"/>
            </Map:MapControl.CenterPoint>
            <Map:ImageTilesLayer>
                <Map:ImageTilesLayer.DataProvider>
                    <Map:BingMapDataProvider
                        BingKey="Your Bing Key Here"
                        Kind="Area"/>
                </Map:ImageTilesLayer.DataProvider>
            </Map:ImageTilesLayer>
        </Map:MapControl>
    </Grid>
</Page>
```

Run the application and see the result.

Lesson 2 - Create a Vector Map

This is the second tutorial of the Map Control Getting Started series. It will guide you through the process of creating a map application with vector items loaded from an external Vector Format Files.

This tutorial consists of the following steps.

- Step 1. Add a Map Control
- Step 2. Load Shapes from a Shapefile
- Step 3. Colorize Shapes
- Step 4. Add a Color Legend
- Result

Step 1. Add a Map Control

To add a Map control to the application, Run MS Visual Studio 2015 or 2017, create a new **Universal | Blank App (Windows Universal)** project and add the MapControl component to your project as you did in Lesson 1.

After this, your XAML should look as follows. If it does not, you can overwrite your code with:

Xaml

```
<Page xmlns:Map="using:DevExpress.UI.Xaml.Map"
    x:Class="MapLesson2.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:MapLesson2"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl/>
    </Grid>
</Page>
```

Step 2. Load Shapes from a Shapefile

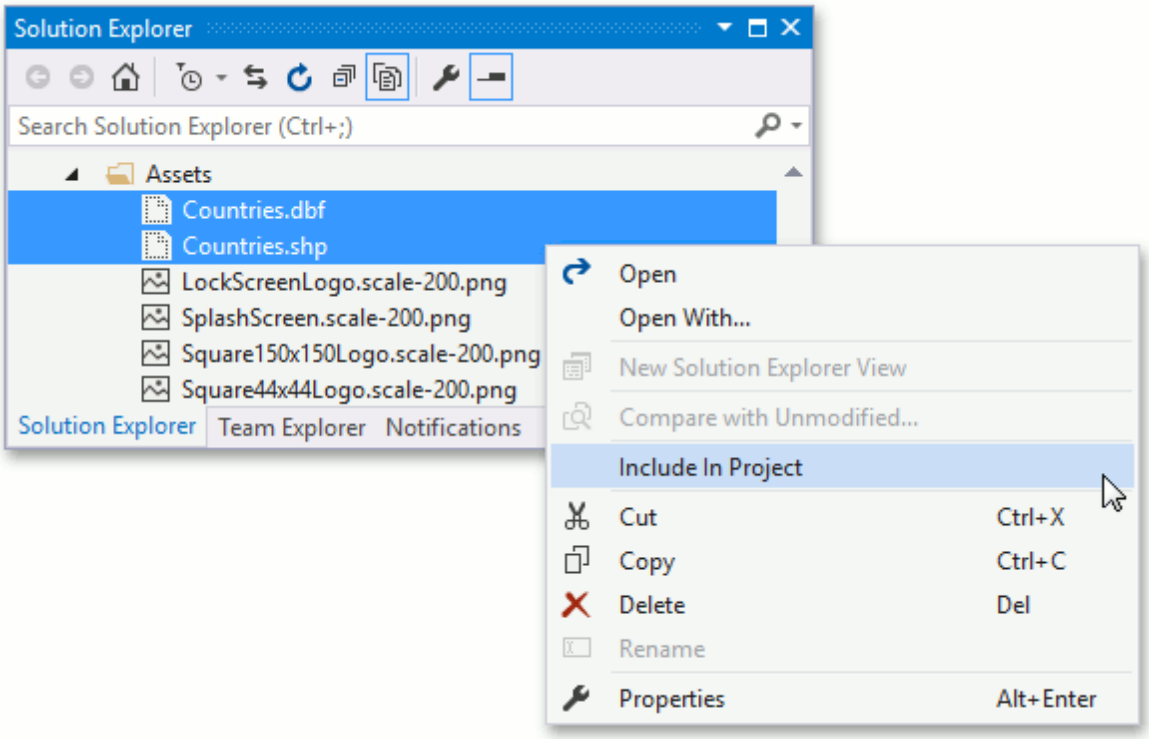
Shape data can be stored in numerous existing data formats. The Map control supports loading data from Shapefile and KML file formats. For this lesson, we can use one of the **Shapefiles** that are shipped with the **DevExpress Map Control**'s demo. By default, these files are installed in the following folder.

C:\Users\Public\Documents\DevExpress Demos 18.1\Universal App ControlsFeatureDemo\CS\FeatureDemo\MapDemo\Data\Shapefiles

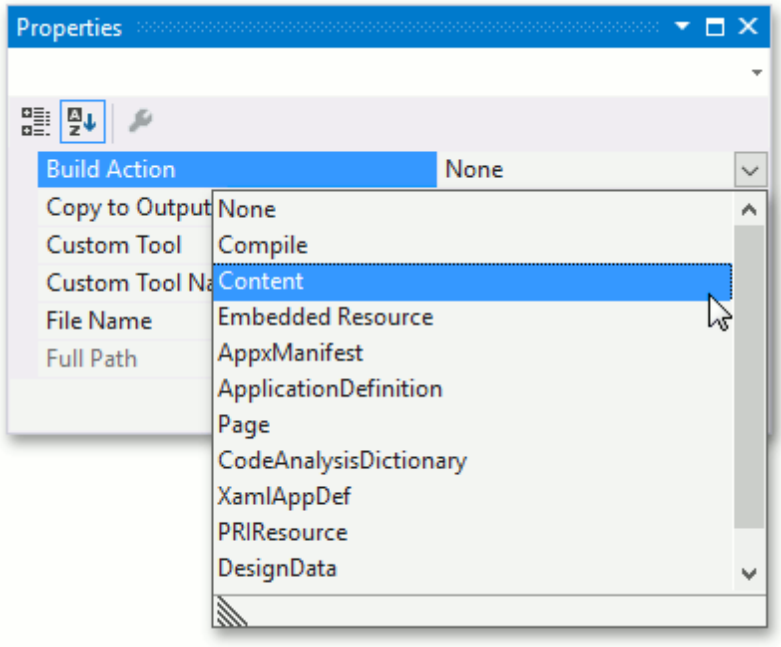
To load data from a Shapefile, do the following.

- Copy the **Countries.shp** and **Countries.dbf** files to the **Assets** directory of your project and include these files in your solution.

© 2018 Developer Express Inc.

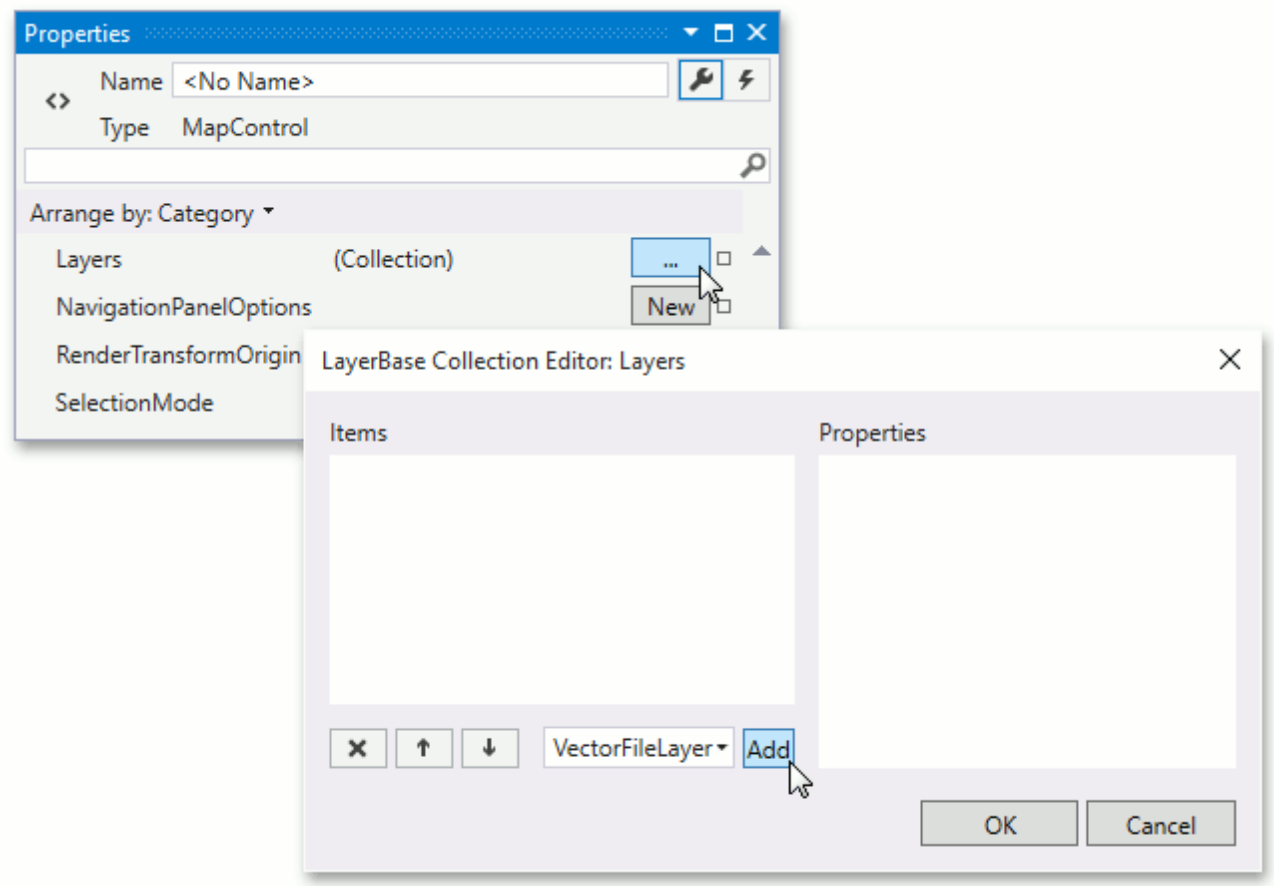


- For both files, set the **Build Action** property to **Content**.



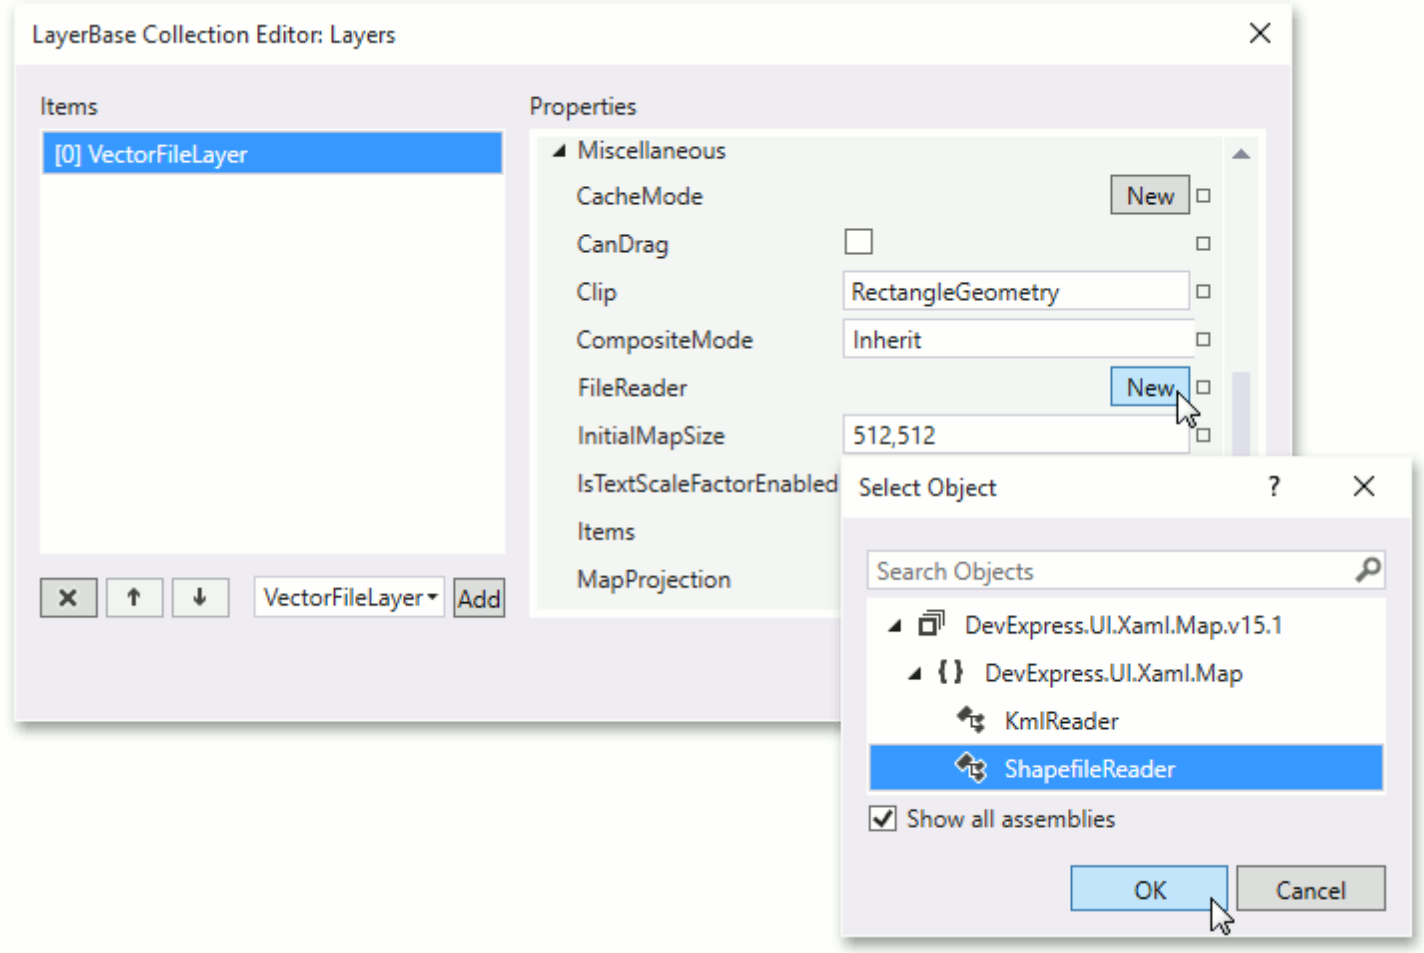
- In the **Properties** window, locate the MapControl.Layers property, click the ellipsis button. In the invoked window, add a VectorFileLayer object to the collection.

© 2018 Developer Express Inc.



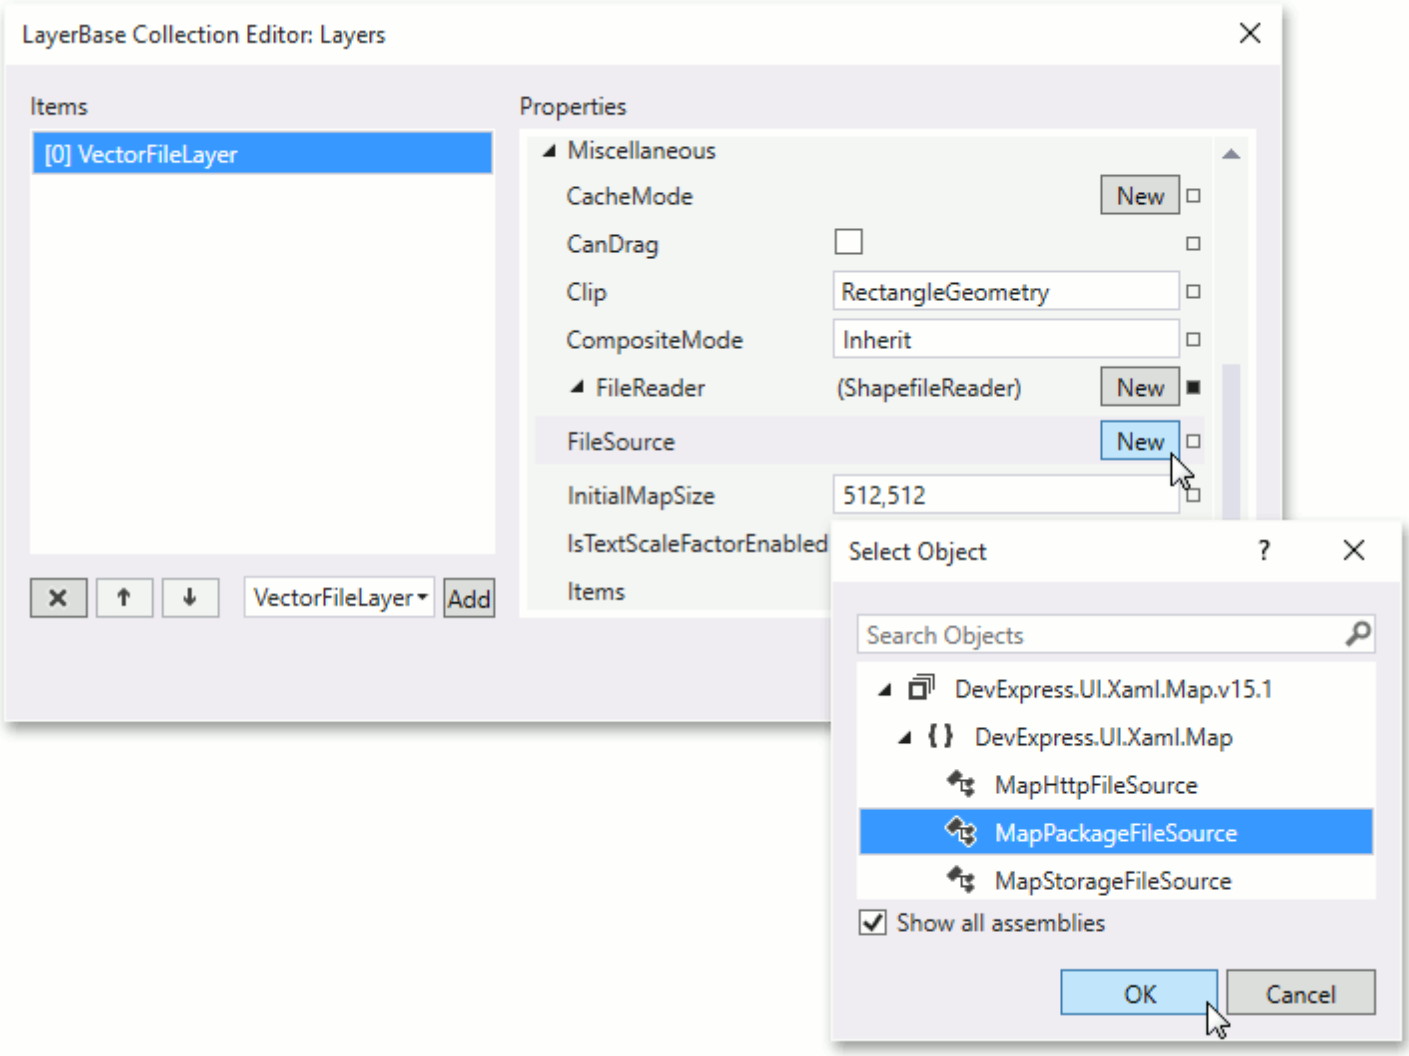
- For the added **VectorFileLayer** object, assign a ShapefileReader object to the VectorFileLayer.FileReader property.

© 2018 Developer Express Inc.



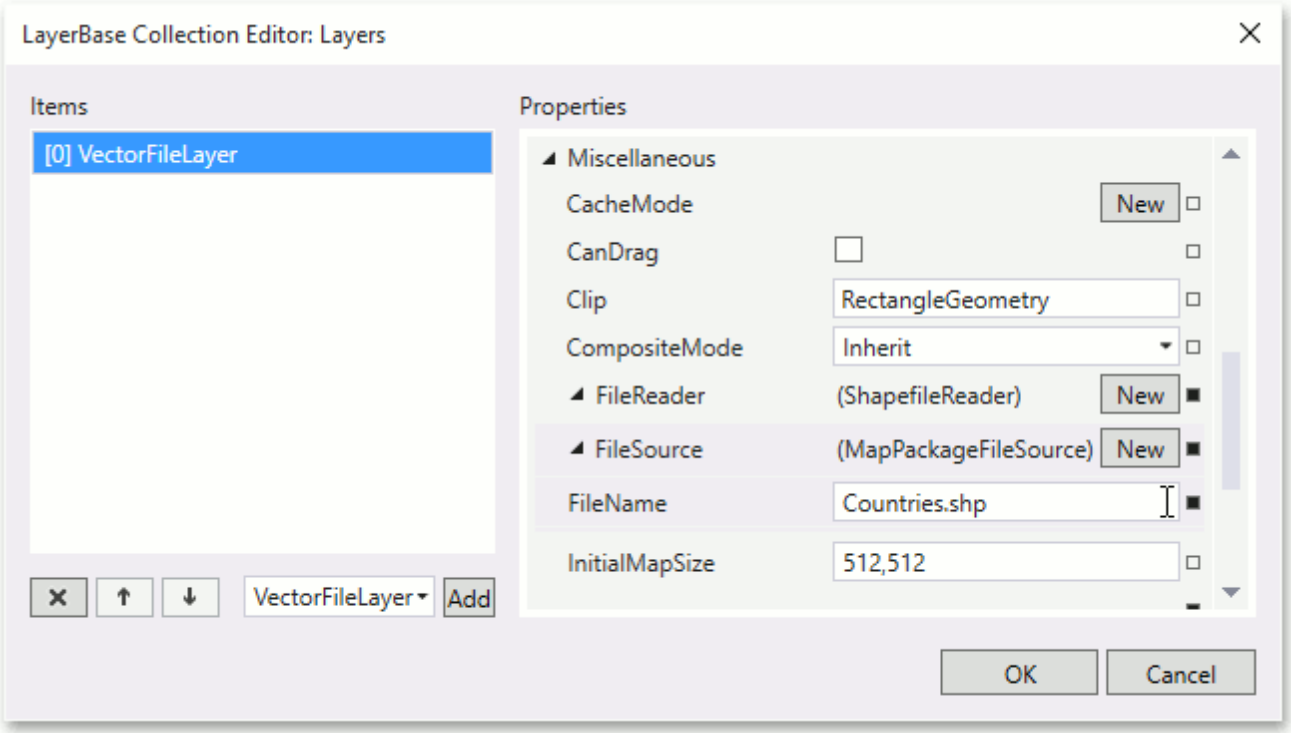
- Assign a MapPackageFileSource object to the MapFileReaderBase.FileSource property.

© 2018 Developer Express Inc.

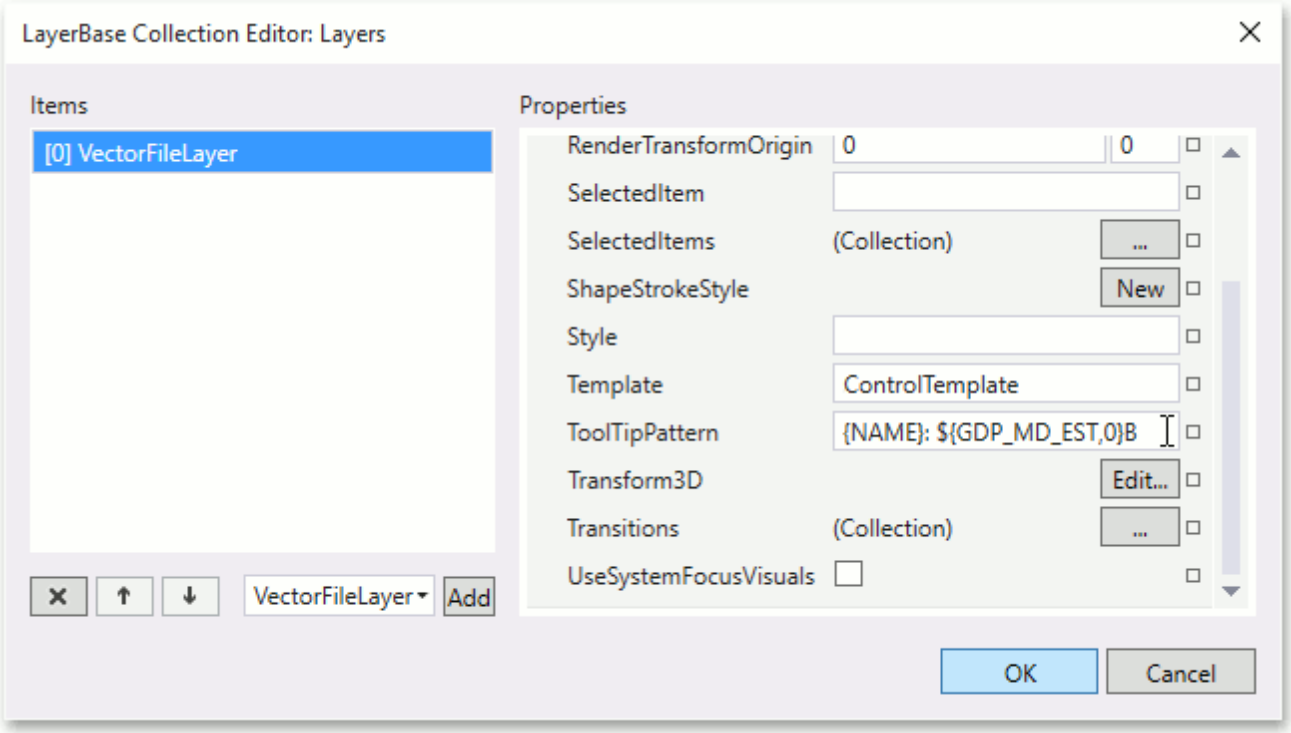


- Set the MapPackageFileSource.FileName property value to *Data\Countries.shp*.

© 2018 Developer Express Inc.



- Set the MapItemsLayerBase.ToolTipPattern property to *{NAME}: ${GDP_MD_EST}M*.



Then click **OK** to close the window and execute the changes.

After performing these steps, your XAML should look like this.

Xaml	

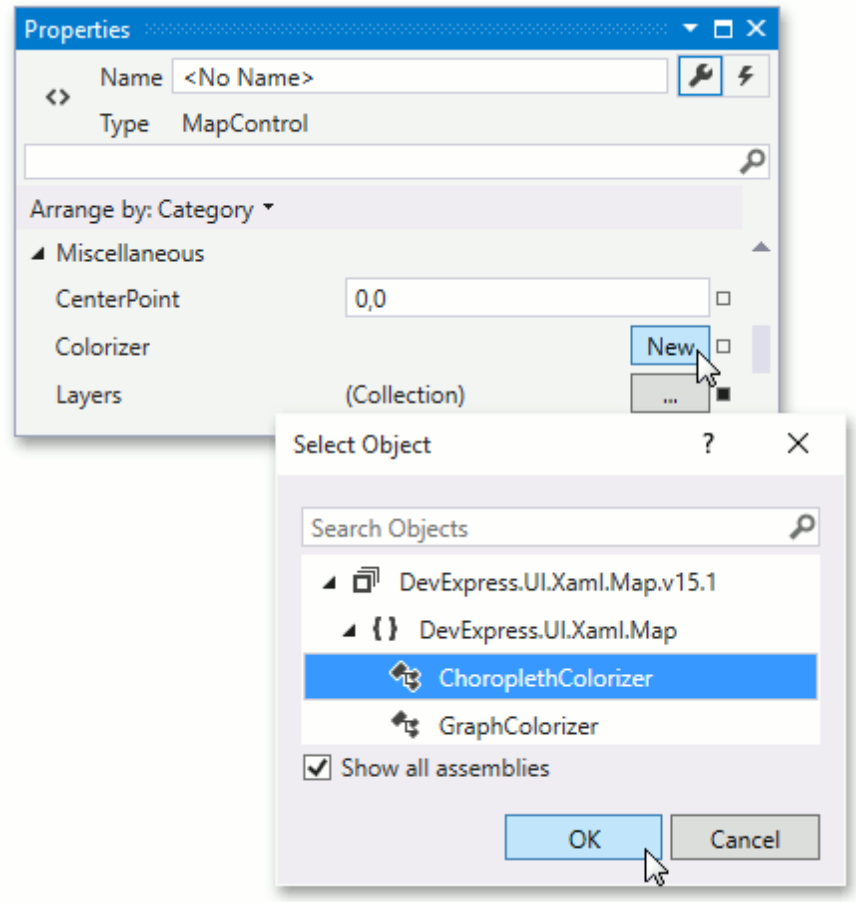
© 2018 Developer Express Inc.

```
<Page xmlns:Map="using:DevExpress.UI.Xaml.Map"
    x:Class="MapControl_Lesson2.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:local="using:MapControl_Lesson2"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl>
            <Map:VectorFileLayer ToolTipPattern="{}{NAME}: ${GDP_MD_EST}M">
                <Map:ShapefileReader>
                    <Map:MapPackageFileSource FileName="Countries.shp"/>
                </Map:ShapefileReader>
            </Map:VectorFileLayer>
        </Map:MapControl>
    </Grid>
</Page>
```

Step 3. Colorize Shapes

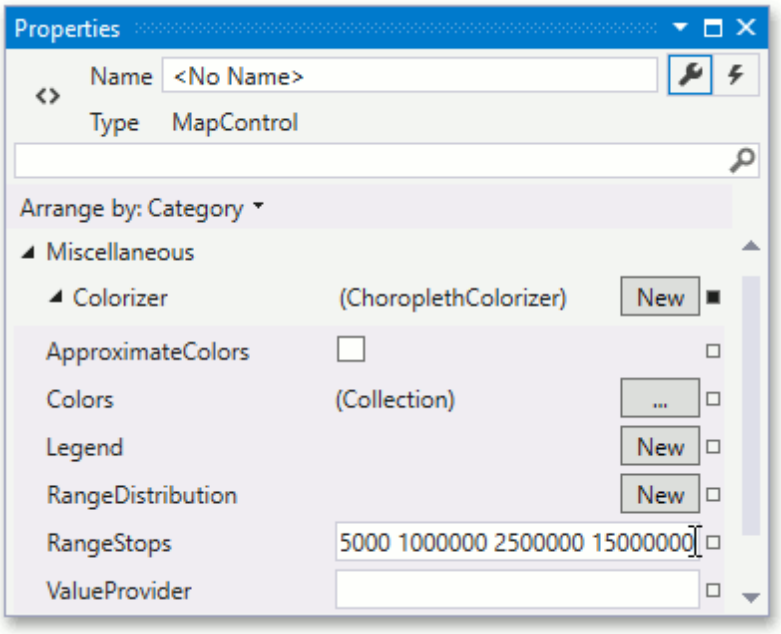
Loaded country shapes can be colorized to represent, for example, a political or statistical map. To colorize data, do the following.

- Create a ChoroplethColorizer object and assign it to the MapControl.Colorizer property.

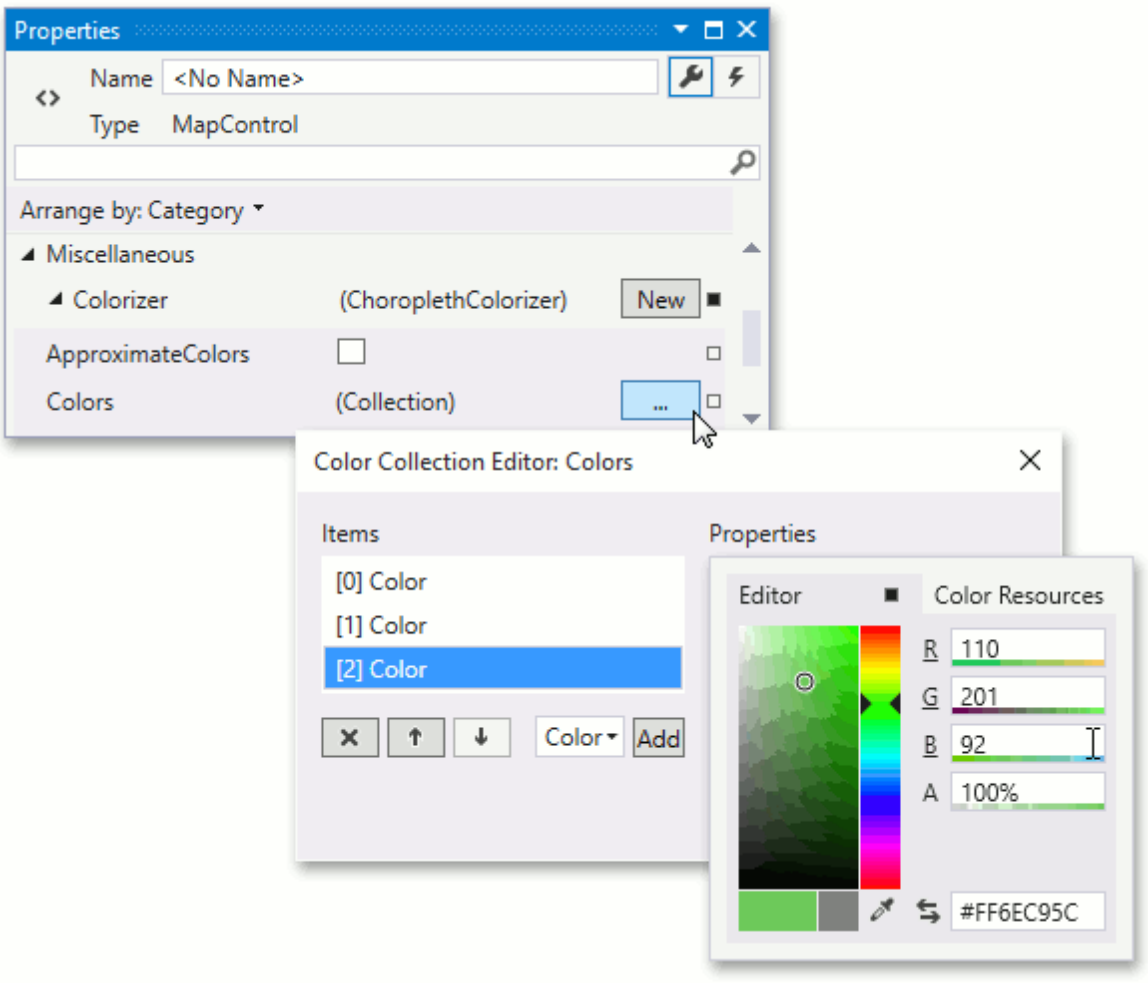


- Set the ChoroplethColorizer.RangeStops collection value to *0 3000 10000 18000 28000 44000 82000 185000 1000000 2500000 15000000*.

© 2018 Developer Express Inc.



- Specify the MapColorizer.Colors collection. For this, locate the property and click the ellipsis button. In the invoked window, add the following list of colors.
  1. R=255, G=90, B=25
  2. R=229, G=227, B=53
  3. R=110, G=201, B=92



© 2018 Developer Express Inc.

- Assign a ShapeAttributeValueProvider object to the ChoroplethColorizer.ValueProvider property. Set the ShapeAttributeValueProvider.AttributeName property value to *GDP_MD_EST*.

If you run the application now, it should look as follows.

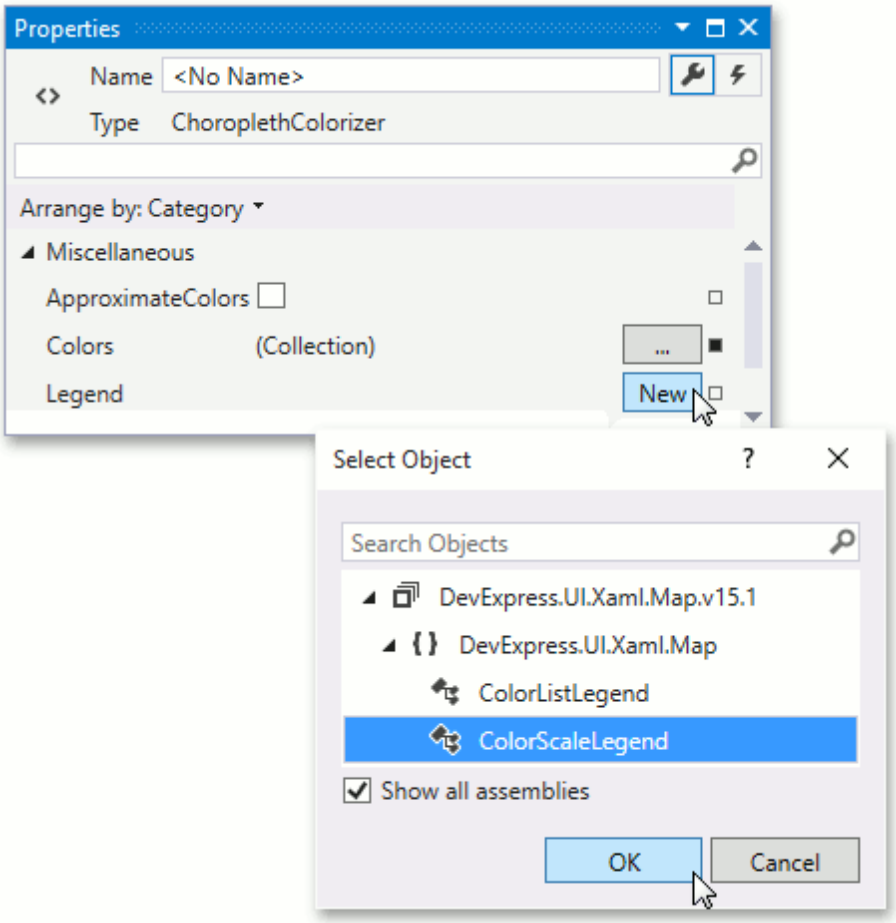
Right now, it is hard to determine which color belongs to which value range. To solve this problem, add a color legend.

Step 4. Add a Color Legend

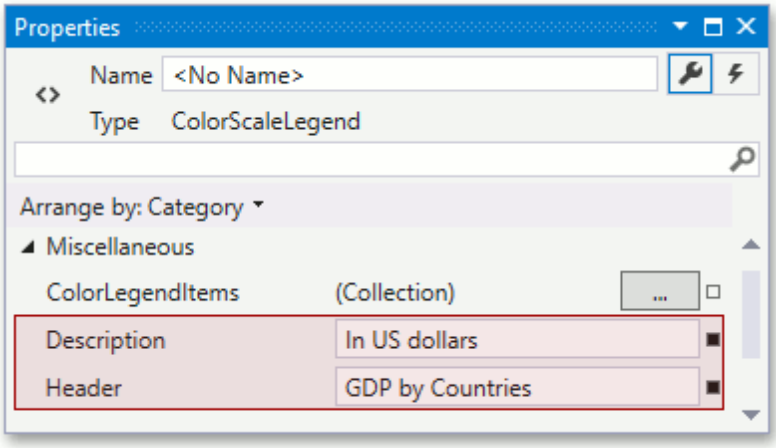
Do this as follows:.

- Assign a ColorScaleLegend object to the ChoroplethColorizer.Legend property.

© 2018 Developer Express Inc.

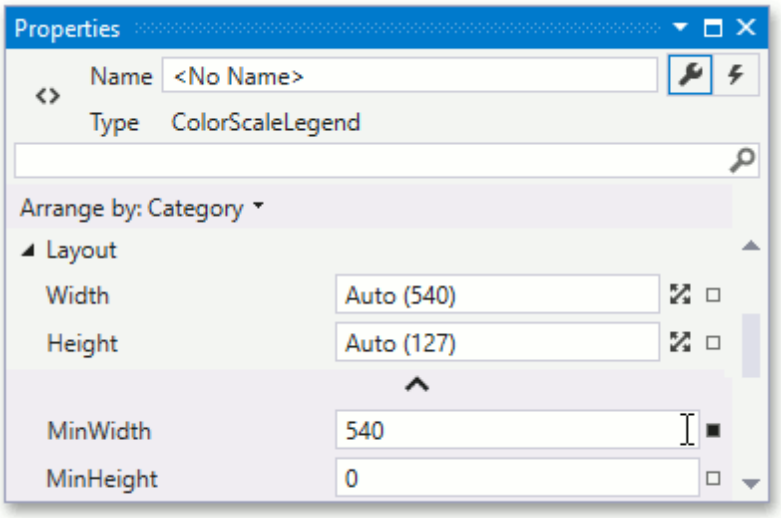


- Set the ColorScaleLegend.Header to *GDP by Countries* and the ColorScaleLegend.Description to *In US dollars*.

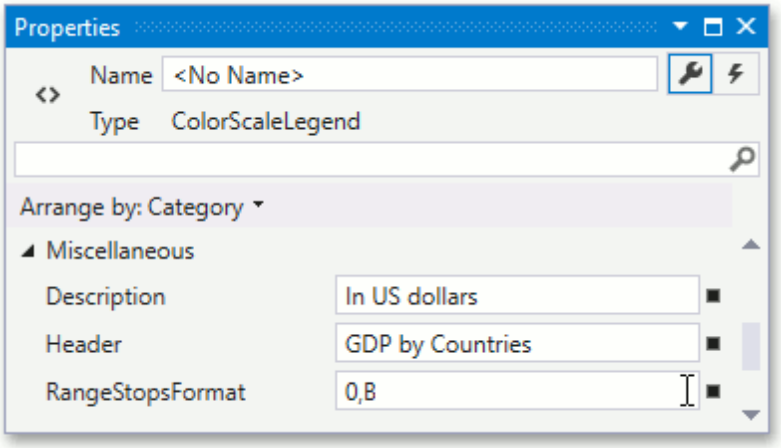


- Set the **MinWidth** property of the legend to **550**.

© 2018 Developer Express Inc.



- Set the ColorLegend.RangeStopsFormat property value to **0,B**.



Result

The application code should look as follows.

Lesson 3 - Load Vector Data from an External Data Source

This tutorial describes how to load data to the MapControl from an external source. In this example, you will use an external XML file.

The XML data source contains information about wrecked ships, including ship coordinates.

To bind the map control to an XML data source, follow the instructions below.

- Step 1. Add a Map Control
- Step 2. Add an XML File to the Application
- Step 3. Add an Image for Generated Vector Items
- Step 4. Load Data from External Source
- Result

Step 1. Add a Map Control

Run MS Visual Studio 2015 or 2017, create a new **Universal | Blank App (Windows Universal)** project, add the MapControl component to your project as you did in Lesson 1 and connect the MapControl to MS the Bing Maps image tiles data provider (refer to Lesson 1 to learn how to do this).

Modify the map's initial view by setting the MapControl.CenterPoint property value to **-35, 145**. Change the current map zoom level by setting the MapControl.ZoomLevel property to **6**. When data is loaded, map items will located at this location.

After this, your XAML should look as follows. If it does not, you can overwrite your code with:

Xaml

```
<Page xmlns:Map="using:DevExpress.UI.Xaml.Map"
    x:Class="MapControl_Lesson3.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:MapControl_Lesson3"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl ZoomLevel="6">
            <Map:MapControl.CenterPoint>
                <Map:GeoPoint Latitude="-35" Longitude="145"/>
            </Map:MapControl.CenterPoint>
            <Map:ImageTilesLayer>
                <Map:ImageTilesLayer.DataProvider>
                    <Map:BingMapDataProvider BingKey="Your Bing Key"/>
                </Map:ImageTilesLayer.DataProvider>
            </Map:ImageTilesLayer>
        </Map:MapControl>
    </Grid>
</Page>
```

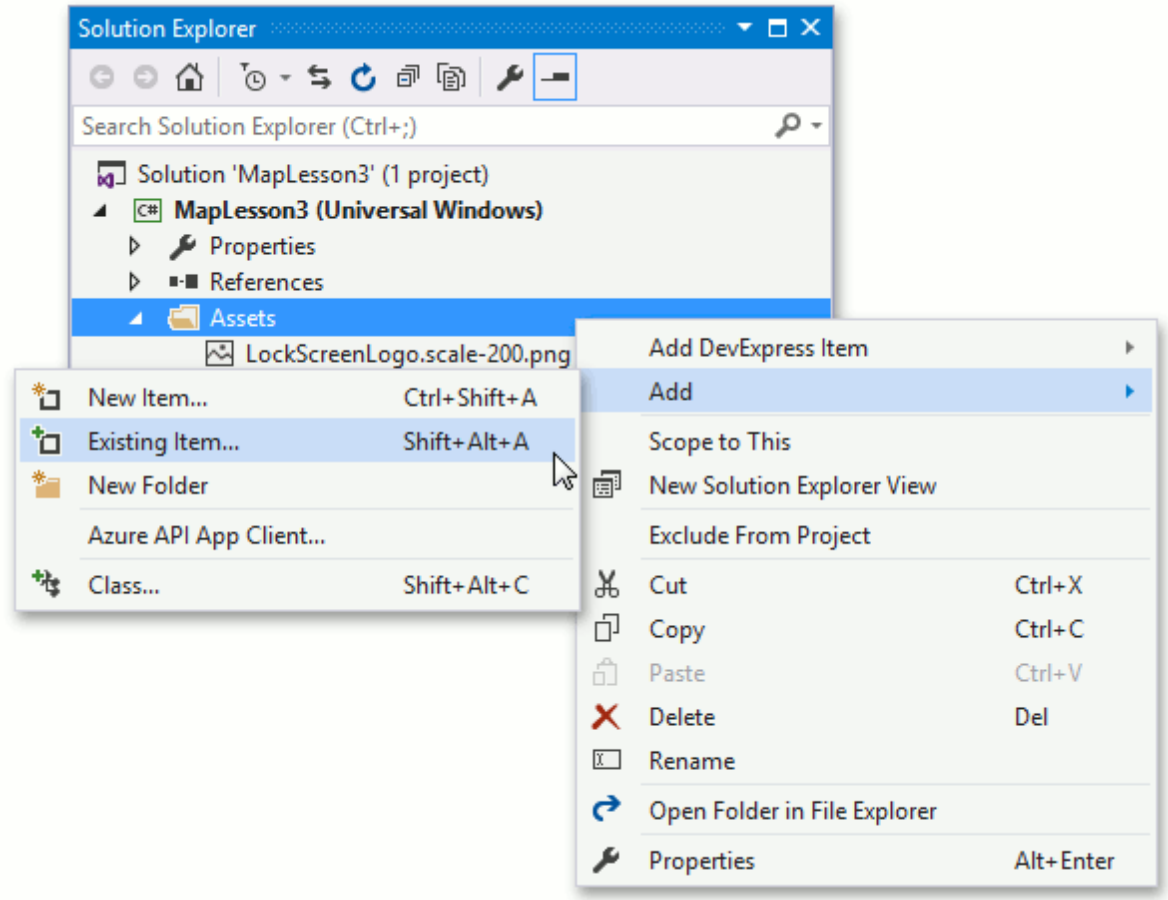
Step 2. Add an XML File to the Application

In this step, you will add the Ships XML data file to the application. The XML file contains data about wrecked ships. The map control will use this as the data source.

To add an XML data file to the project, do the following.

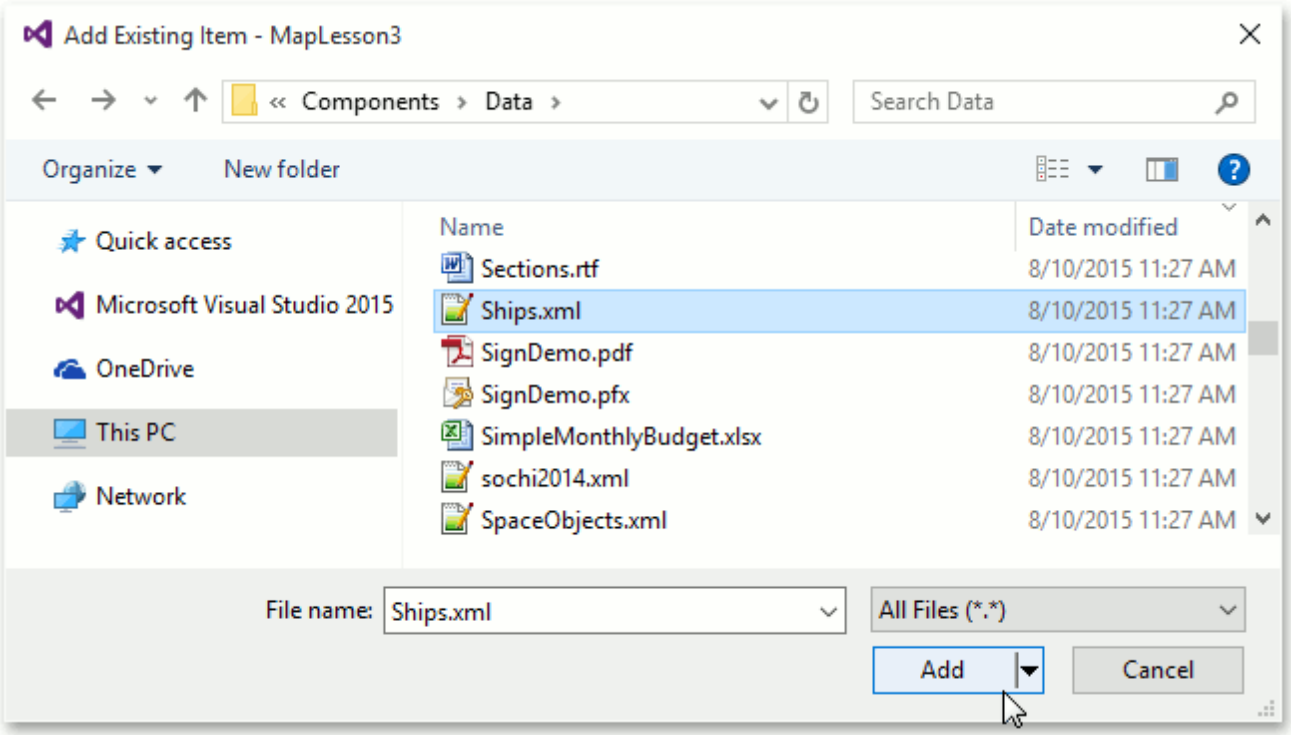
- Right-click the project in the Solution Explorer and choose Add | Existing Item... from the context menu.

© 2018 Developer Express Inc.



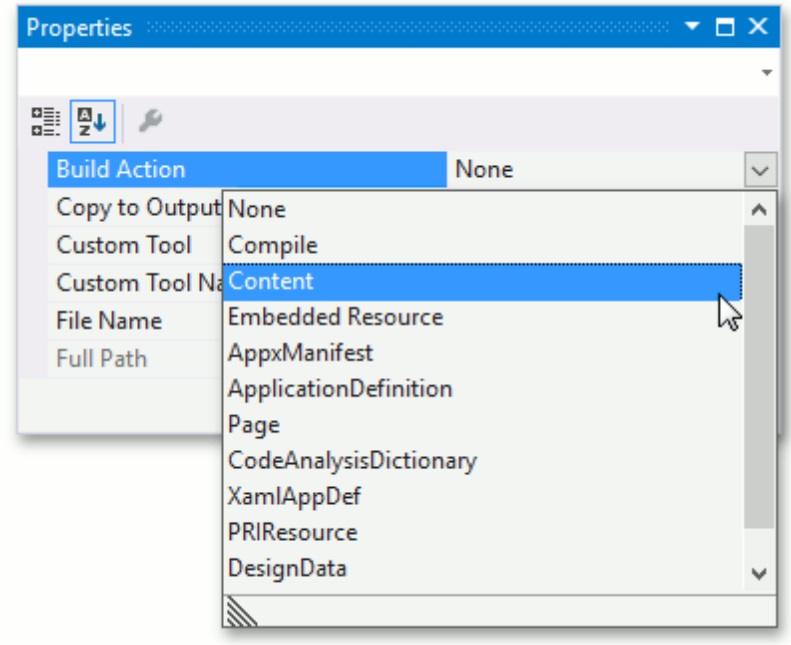
This invokes the **Add Existing Item** dialog.

- In the Add Existing Item dialog, locate the *C:\Users\Public\Documents\DevExpress Demos 18.1\Universal App Controls\Data\Ships.xml* file and click **Add** to close the dialog.



© 2018 Developer Express Inc.

- Add the XML file to the application resource. To do this, click the XML file in the **Solution Explorer** and in the **Properties** window, set the **Build Action** property to **Content**.



Now, the **Ships.xml** file is added to the application content.

Step 3. Add an Image for Generated Vector Items

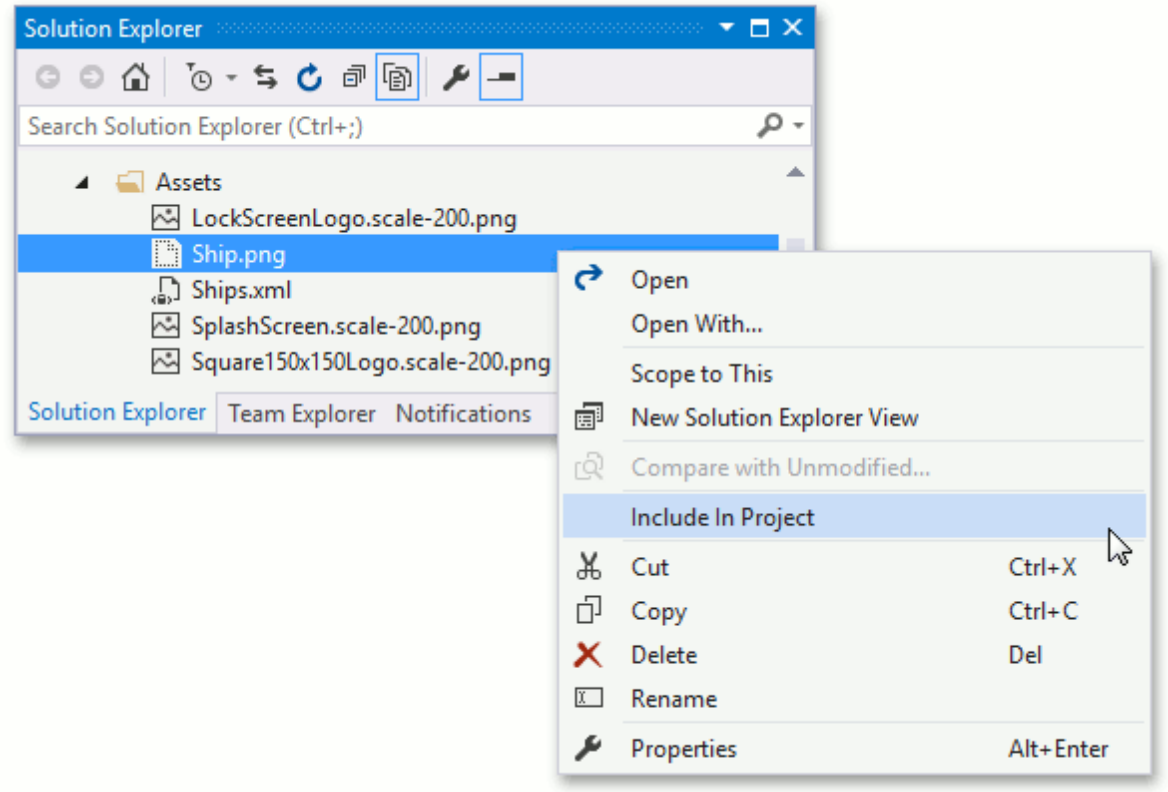
Next, you will need to add an image that will be displayed at the location of each shipwreck.

For this, right-click the image below, select **Save picture as...** menu item, in the invoked window specify its name as **Ship.png**, and save it to the disk in the *<ApplicationFolder>\Assets* folder. Note that you can use any other image.

Now, include the **Ship.png** image to the project. To do this, execute the following steps.

- Click **Show All Files** in the Solution Explorer.
- Right-click **Ship.png** and select the **Include In Project** item in the invoked context menu.

© 2018 Developer Express Inc.



Make sure that the **Build Action** of the image is set to **Content**.

Then, create a Data Template for the map item generation based on the XML data. The XAML below shows how this can be done.

Xaml

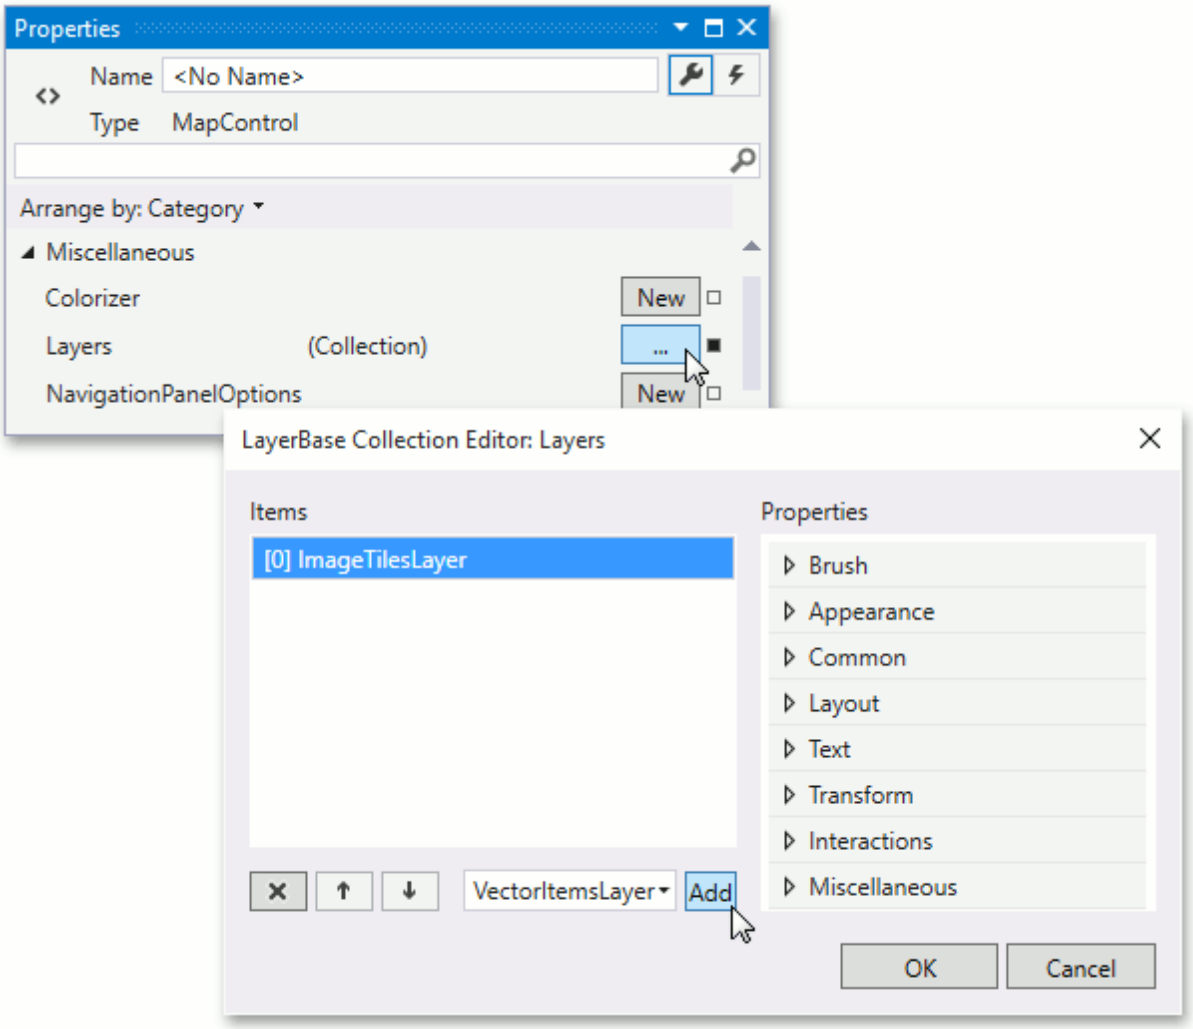
```
<!-- -->
<Page.Resources>
    <DataTemplate x:Key="itemTemplate" x:Name="itemTemplate">
        <Image Width="40" Height="40" Source="Assets/Ship.png" RenderTransformOrigin="0.5,0.5"/>
    </DataTemplate>
</Page.Resources>
<!-- -->
```

Step 4. Load Data from External Source

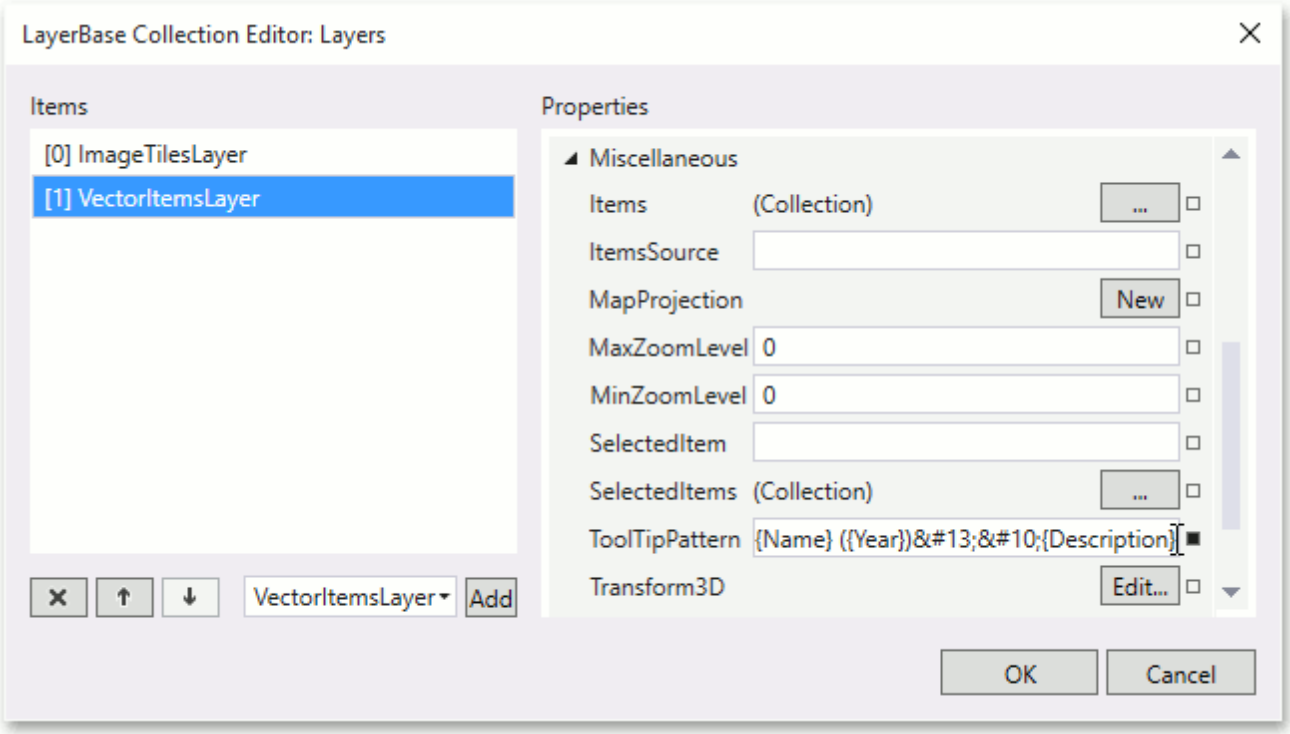
Now let us load and display vector items. Here is how to do it.

- Add a VectorItemsLayer object to the MapControl.Layers collection. To do this, locate the **Layers** property in the **Properites** window and click the ellipsis button to invoke the **Layer Collection Editor**. In the invoked window, select VectorItemsLayer and click **Add**.

© 2018 Developer Express Inc.



- Set the MapItemsLayerBase.ToolTipPattern property to *{Name} ({Year})
{Description}*.



© 2018 Developer Express Inc.

Click **OK** to close the window and execute the changes.

- Switch to the main page source code and write the following code.

Layers

This document describes the purpose of layers, and the types of layers used in a Map Control.

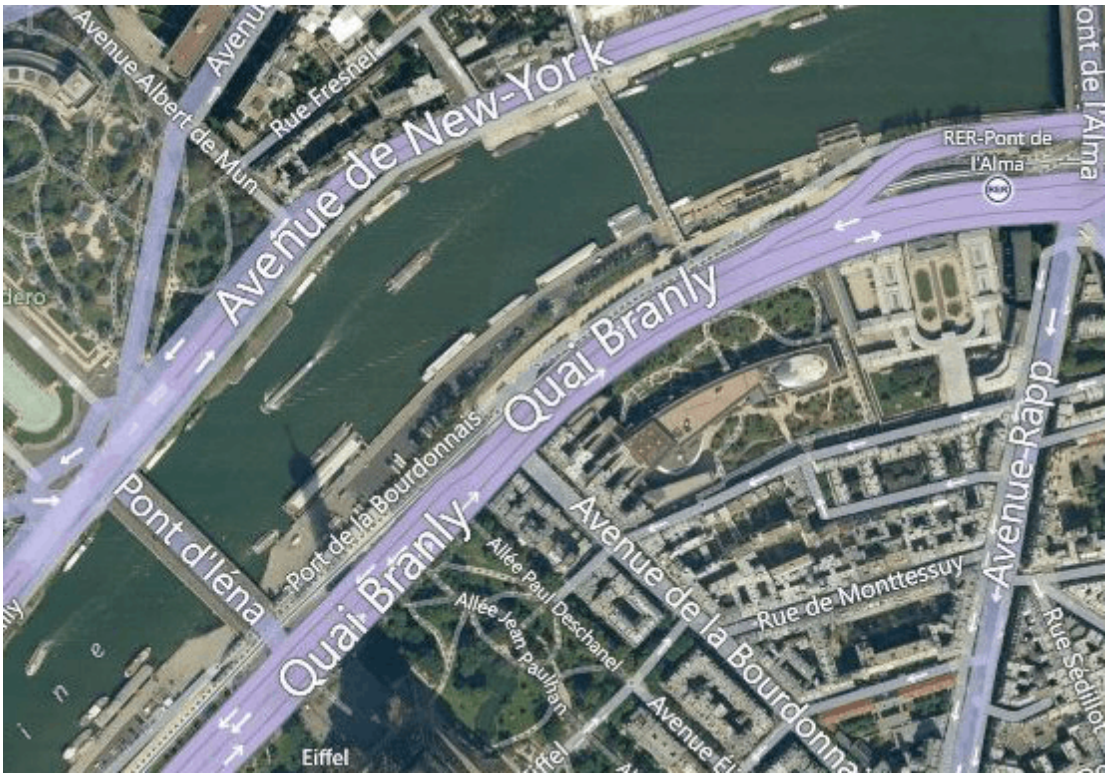
Layers draw data on a map and are stored in a LayerCollection returned by the MapControl.Layers property.

There are several types of layers.

- ImageTilesLayer

This layer should be used to draw maps that consist of image tiles. These image tiles are obtained by the **ImageTilesLayer** from one of the supported data providers - either **Bing Maps** or **OpenStreetMap**. The type of the current data provider is defined by the type of the object assigned to the ImageTilesLayer.DataProvider property of the layer.

Below is a screenshot of map images provided by **Bing Maps** for the **ImageTilesLayer** object.



- VectorItemsLayer

This layer should be used to draw vector elements on a map. These elements include predefined or custom items.

The image below illustrates a map with a vector items layer containing map custom elements.

© 2018 Developer Express Inc.

- VectorFileLayer

This layer should be used to draw shapes on a map loaded from one of the supported shape file formats (Shapefile or KML).

To do this, it is necessary to assign an appropriate file reader to the VectorFileLayer.FileReader property and specify the file reader's MapFileReaderBase.FileSource property value.

The following image shows a map based on vector items loaded from a Shapefile.

Map Image Data

This document describes the types of predefined map image data providers supported by the Map control and details information on how to use them.

Map control uses the ImageTilesLayer to display image tiles from one of the imagery services. To do this, assign one of the following data providers to the ImageTilesLayer.DataProvider property.

Currently, the following map images data provider types are supported.

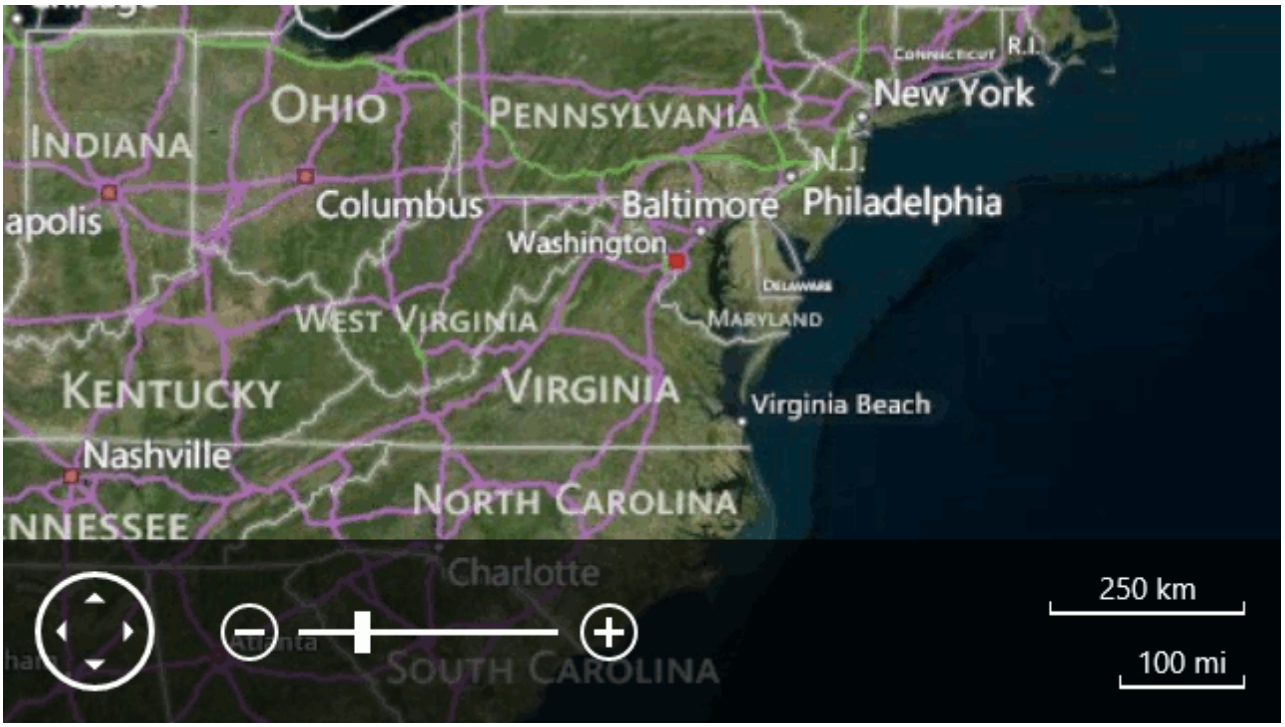
Bing Maps Data Provider

This data provider loads image tiles from the MS Bing Maps imagery service. To work with this provider, use the BingMapDataProvider class.

For information on how to use it, refer to How to: Use the BingMapDataProvider.

Note
If you run the application and see a window with the following error message: *"Access was denied. You may have entered your credentials incorrectly, or you might not have access to the requested resource or operation."*, refer to the following tutorial: How to: Get a Bing Maps Key.

The following image shows the map control connected to the MS Bing Maps provider.



OpenStreetMap Data Provider

This data provider loads data from the OpenStreetMap service. To work with this provider, use the OpenStreetMapDataProvider class.

For more information how to use it, refer to How to: Use the OpenStreetMapDataProvider

Note
Before using map images in the **OpenStreetMap** format, please review the Copyright and License and Tile usage policy pages. To control which web resource should be used in your application as an **OpenStreetMap** data provider, you should assign specific values for the OpenStreetMapDataProvider.TileUriTemplate property. Note that by default, this property is set to obtain data from the OpenStreetMap official web service.

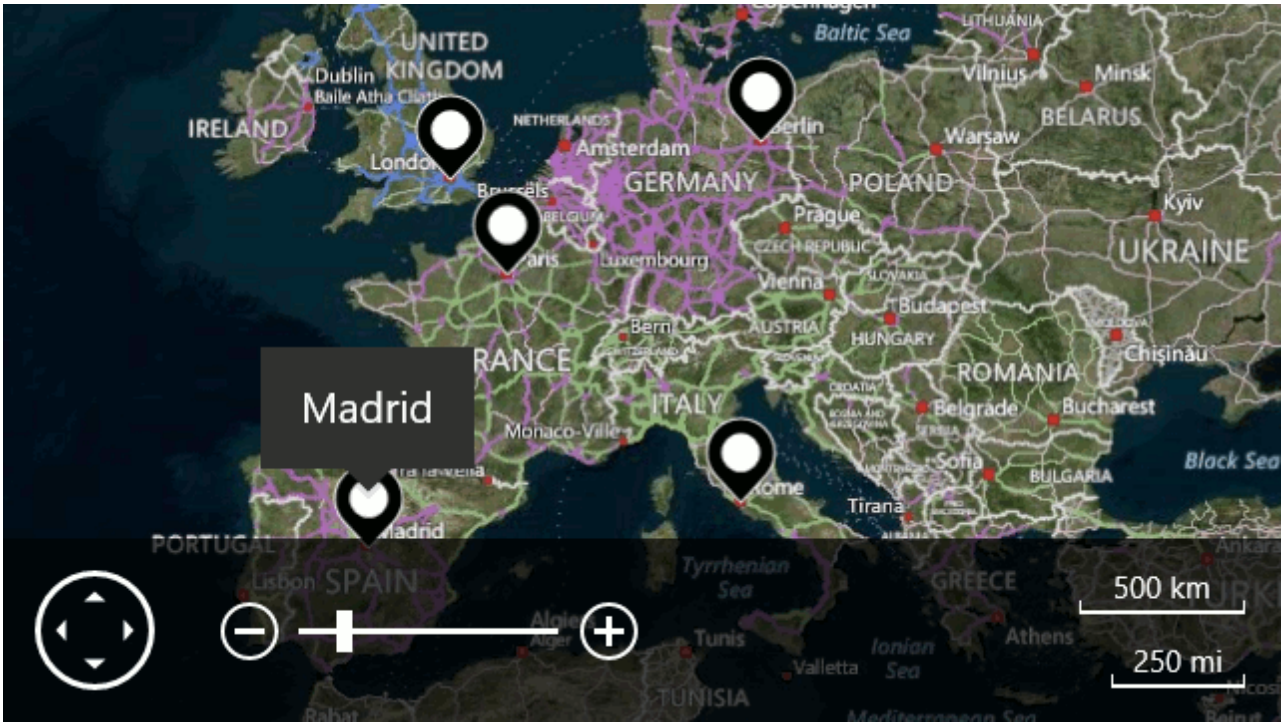
Providing Vector Items to a Map Control

It is possible to add vector items to a map control manually. To do this, create a VectorItemsLayer object and add it to the MapControl.Layers collection. After this, there are two ways of providing vector items to a map.

Using the Items Property

The VectorItemsLayer.Items property allows you to work with elements of this collection, but does not allow changing the collection itself.

The following image illustrates several MapPushpin items provided to the map, using the VectorItemsLayer.Items property.



To learn more on how to manually generate items, refer to How to: Add Vector Items to a Map Using XAML.

Using the ItemsSource Property

The VectorItemsLayer.ItemsSource property allows you to specify the collection of vector items that are displayed by a map.

The following image illustrates several MapCustomElement objects stored in the external source and provided to the vector layer using the VectorItemsLayer.ItemsSource property.

© 2018 Developer Express Inc.

To learn more on how to manually generate items, refer to How to: Bind Vector Item Source to Map Control.

Vector Format Files

This document lists supported vector formats, and explains how to import and visualize data from these formats in a map control. The following vector formats are supported.

- Shapefiles
- KML

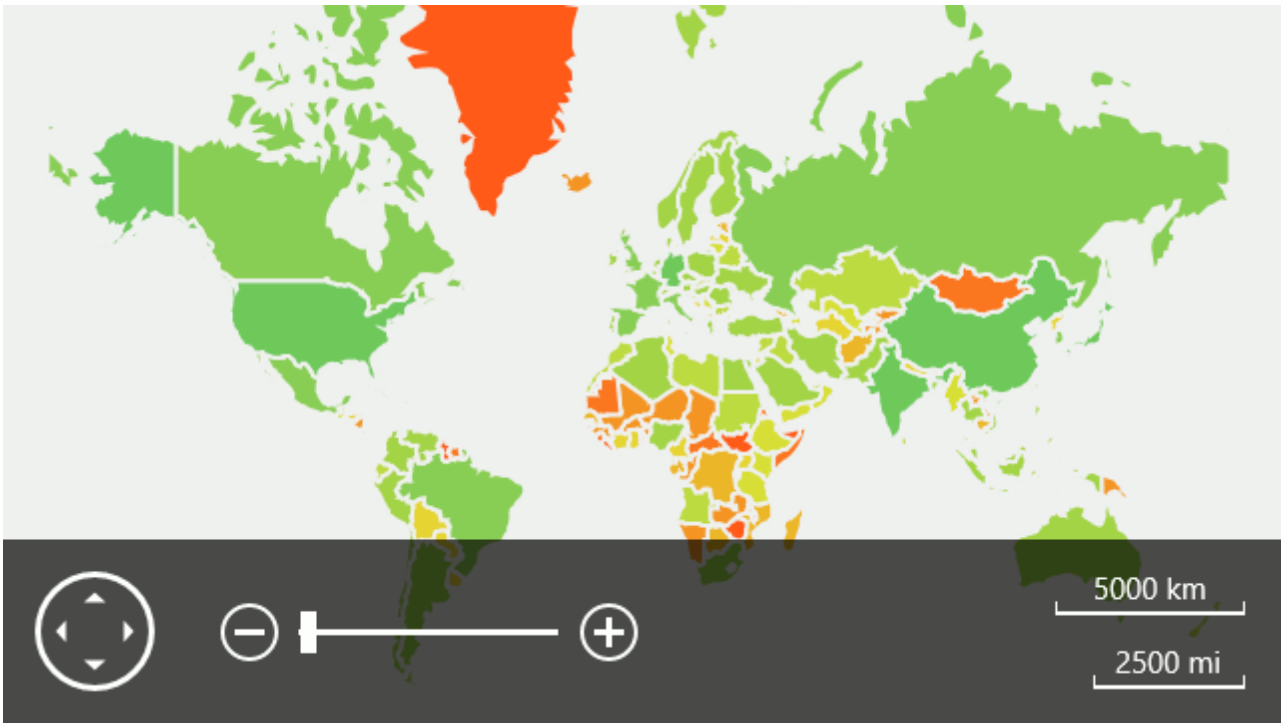
Shapefiles

A **Shapefile** (Esri Shapefile) is a vector format that represents geographic data (e.g., rivers, lakes, and countries) using geometric shapes (e.g., points, polylines, and polygons). Data in this format is usually stored in two files:

- a **.shp** file, which contains data about geometric shapes;
- a **.dbf** file, which contains data associated with geometric shapes from the corresponding **.shp** file.

Note
To learn more about the Shapefile format, refer to Shapefile (Wikipedia).

The image below illustrates country shapes, along with supplemental information (country names and GDP above country shapes) loaded from a Shapefile.



To load shapes from a Shapefile, do the following.

- Create a ShapefileReader object and assign it to the VectorFileLayer.FileReader property.
- Specify the path to a Shapefile using one of the MapFileSourceBase class descendant objects assigned to the MapFileReaderBase.FileSource property.

Note
Make sure the **Build Action** property of both shape files is set to **Content**.

When data is loaded from a Shapefile, the Map control generates a collection of vector items stored in a VectorFileLayer. Note that in this case, data from a **.dbf** file is stored as **attributes** in each vector item object. This approach allows you, for instance, to use this data to colorize shapes or display supplementary information in shape tooltips.

To learn how this can be done, see the How to: Load Vector Data from Shapefile topic.

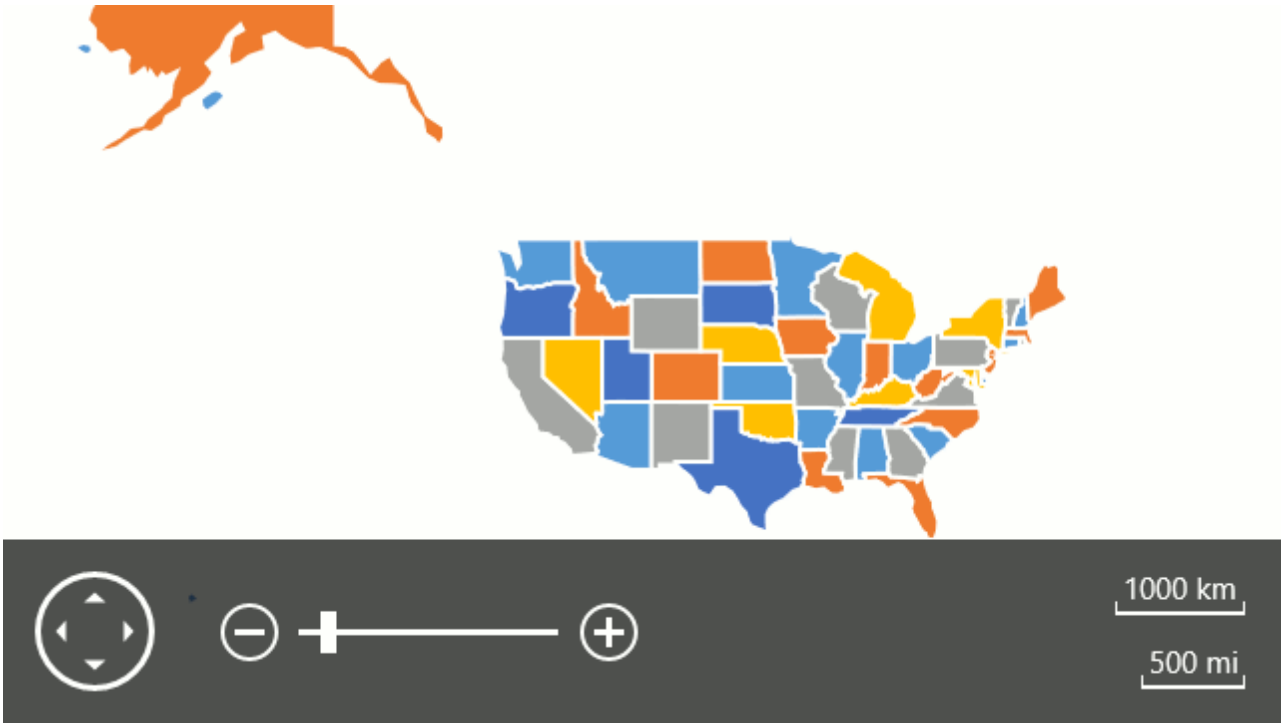
© 2018 Developer Express Inc.

KML

Using the Map control, you can load and depict any set of geographic visualization data (placemarks, polygons, images, textual descriptions, etc.) stored in the KML (Keyhole Markup Language) format. KML files have a tag-based structure with nested elements (similar to the XML standard).

Note
For more information, see the following link: KML Documentation (on developers.google.com).

One of the common usage scenarios for the KML format is to display vector data above an image tiles map. For instance, the image below shows the Liberty Island shape loaded from a KML file.



To load geographic data from a KML file, do the following.

- Create a KmlReader object and assign it to the VectorFileLayer.FileReader property.
- Specify the path to a KML file using one of MapFileSourceBase class descendant objects assigned to the MapFileReaderBase.FileSource property.

Note
Make sure the **Build Action** property of a KML file is set to **Content**.

To learn how this can be done, see the How to: Load Vector Data from a KML File topic.

Colorizers

This document introduces the Map Colorizer, lists colorizer types, and explains how to create a colorizer and customize its settings.

The document consists of the following sections.

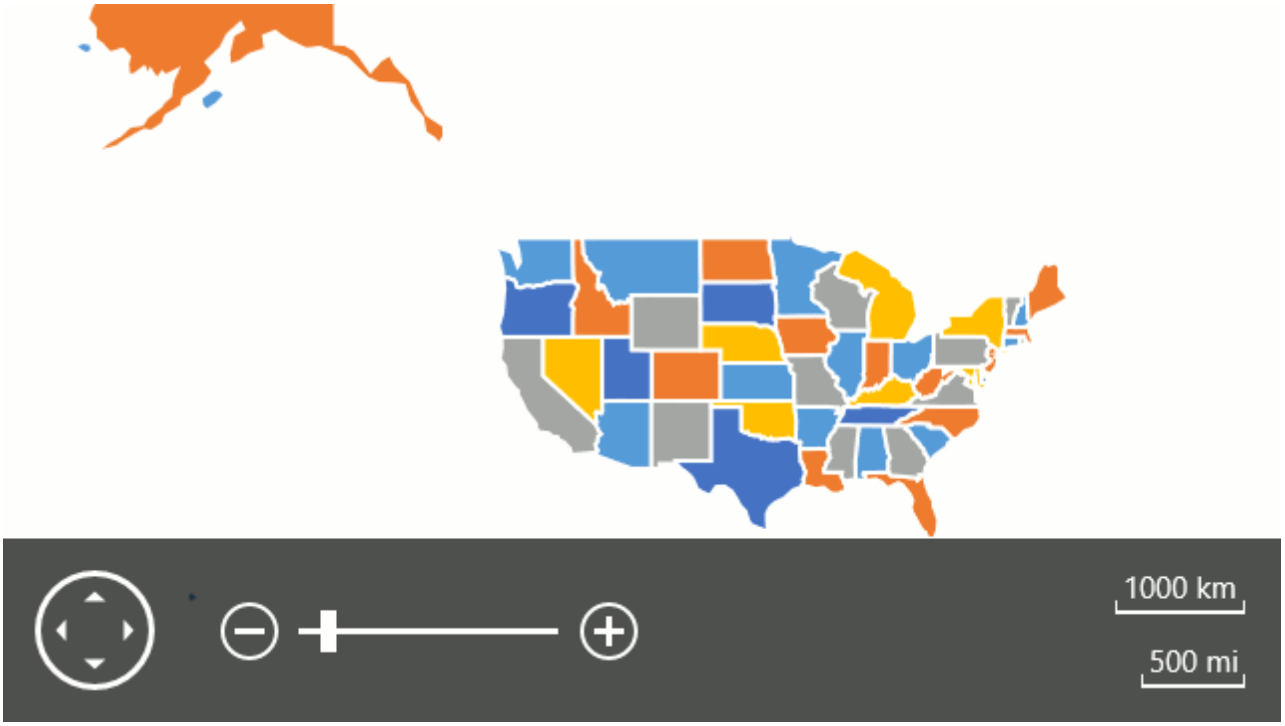
- Overview
- Graph Colorizer
- Choropleth Colorizer

Overview

The Colorizer is used to automatically choose colors for map shapes based on shape data. This feature can be applied to the following MapShape class descendants that utilize the MapShape.Fill property:

- MapDot
- MapEllipse
- MapLine
- MapPolygon
- MapPolyline
- MapPath
- MapRectangle

For example, you can use the map colorizer to create GDP, population or political maps.



Before using this feature, perform the following steps.

1. Provide vector data which will be colorized. To learn how to do this, refer to the Providing Data examples section.
2. Choose which colorizer type is going to be used in your application.
   - GraphColorizer

Represents the Graph colorizer, which paints shapes that have a common border using different colors according to the Graph Coloring approach. For instance, the Graph colorizer can be used to create a political map.

Note	
Note colorize data loaded from a KML file only possible using a graph colorizer.	

© 2018 Developer Express Inc.

- ChoroplethColorizer

Represents the Choropleth colorizer, which shows statistical data over predefined regions (such as counties or states) by coloring or shading these regions.

Then, assign the selected colorizer type object to the MapControl.Colorizer property.

After that, it is possible to customize the map colorizer settings. The sections below describe how this can be done.

Graph Colorizer

To colorize map contours using this colorizer, specify the collection of colors used by the colorizer. To do this, use the MapColorizer.Colors property. The following XAML demonstrates this.

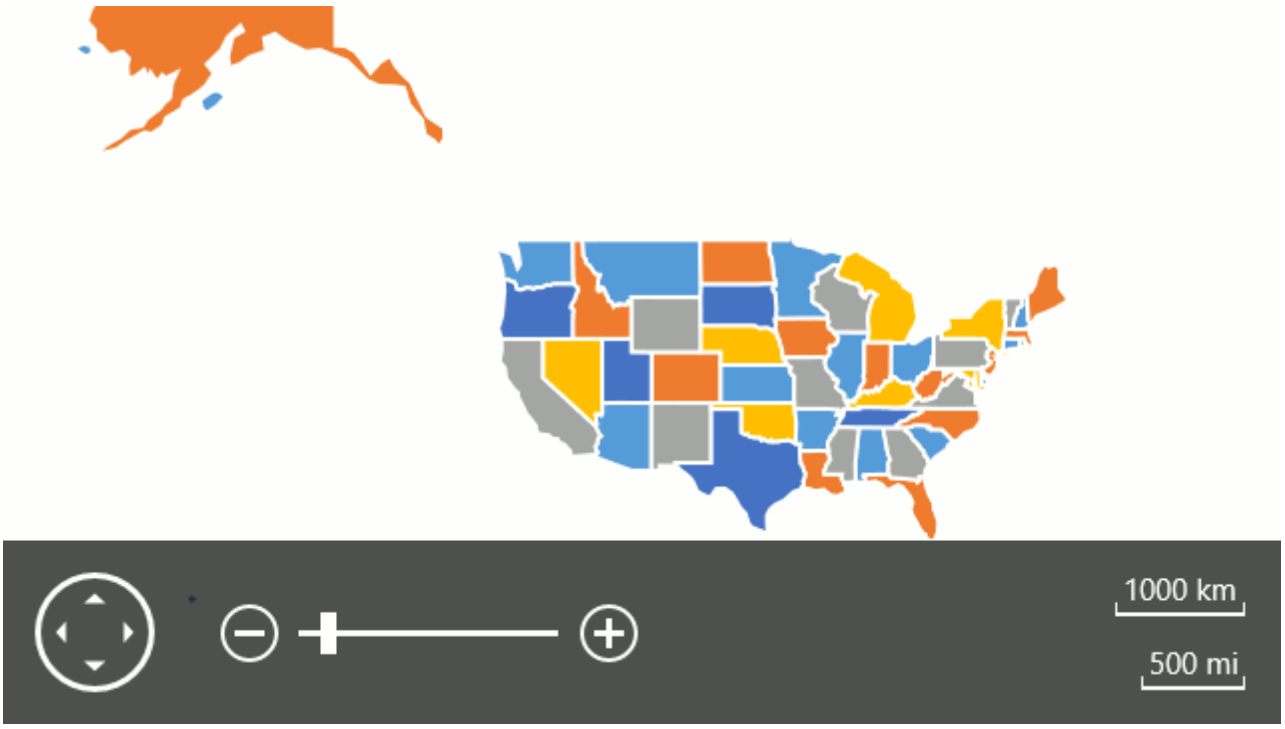
Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279977.

Xaml

```
 (MainPage.xaml)
<Map:MapControl.Colorizer>
    <Map:GraphColorizer>
        <Map:GraphColorizer.Colors>
            <Color>#5b9bd5</Color>
            <Color>#ed7d31</Color>
            <Color>#a5a5a5</Color>
            <Color>#ffc000</Color>
            <Color>#4472c4</Color>
            <Color>#70ad47</Color>
        </Map:GraphColorizer.Colors>
    </Map:GraphColorizer>
</Map:MapControl.Colorizer>
```

As a result, the map shapes appear as follows.



Choropleth Colorizer

To colorize map contours using this colorizer, it is necessary to specify the ChoroplethColorizer.RangeStops collection and the ChoroplethColorizer.ValueProvider property (to access required information associated with shapes) in addition to the MapColorizer.Colors collection. Also, it is possible to use legends for this colorizer. The following XAML demonstrates this.

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279980.

Xaml

```
 (MainPage.xaml)
<Map:MapControl.Colorizer>
    <Map:ChoroplethColorizer
        RangeStops="0 3000 10000 18000 28000 44000 82000 185000 1000000 2500000 15000000">
        <Map:ChoroplethColorizer.ValueProvider>
            <Map:ShapeAttributeValueProvider AttributeName="GDP_MD_EST"/>
        </Map:ChoroplethColorizer.ValueProvider>
        <Map:ChoroplethColorizer.Colors>
            <Color>#FFFF5A19</Color>
            <Color>#FFE5E335</Color>
            <Color>#FF6EC95C</Color>
        </Map:ChoroplethColorizer.Colors>
        <Map:ChoroplethColorizer.Legend>
            <Map:ColorScaleLegend Margin="0" Header="GDP by Countries" Description="In US dollars"
                                  RangeStopsFormat="0,B" MinWidth="400" FontSize="10"/>
        </Map:ChoroplethColorizer.Legend>
    </Map:ChoroplethColorizer>
</Map:MapControl.Colorizer>
```

As a result, the map shapes appear as follows.

Projections

This document explains why map projections are important, lists their supported types, and details how to create various projections in the map control.

Overview

There are numerous ways of depicting the Earth's surface on a map. Depending on usage, the surface can be drawn as a circle, a rectangle, an oval, etc.

Map projections provide numerous methods of representing a spherical surface, or any other three-dimensional body, on a plane. Each map projection distorts the surface in some manner. For instance, the distortion of the **Mercator** projection increases away from the Equator, and is extreme in the polar regions. Thus, it is difficult to say which projection is the best. The best solution is to choose a projection that meets your specific requirements.

For more information, see Map projection.

Map Projections

The following is a list of supported projections provided by the Map Control.

- EllipticalMercatorProjection
- EqualAreaProjection
- EquirectangularProjection
- MillerProjection
- SphericalMercatorProjection

Customization

To create a map projection, do the following.

- Create one of the objects listed above (for instance, the EqualAreaProjection object).
- Assign an object that represents the map projection to the MapItemsLayerBase.MapProjection property.
- In the MapItemsLayerBase.InitialMapSize property, specify the **Width/height aspect ratio** based size for the projection.

For instance, you can find the **Width/height aspect ratio** values for the cylindrical equal-area projection on the following link: Cylindrical equal-area projection.

The images below illustrate the specifics of the cylindrical equal-area projection. The Width/height ratio is in the parenthesis.

- **Lambert** (3.14)

© 2018 Developer Express Inc.

- **Behrmann** (2.36)

© 2018 Developer Express Inc.

- **Trystan Edwards** (2)

© 2018 Developer Express Inc.

- **Gall-Peters** (1.57)

- **Balthasart** (1.3)

© 2018 Developer Express Inc.

Example

The following example demonstrates how to create cylindrical equal-area projections (e.g., Lambert, Behrmann) in the map control: How to: Customize the Cylindrical Equal-Area Projection

Vector Items Attributes

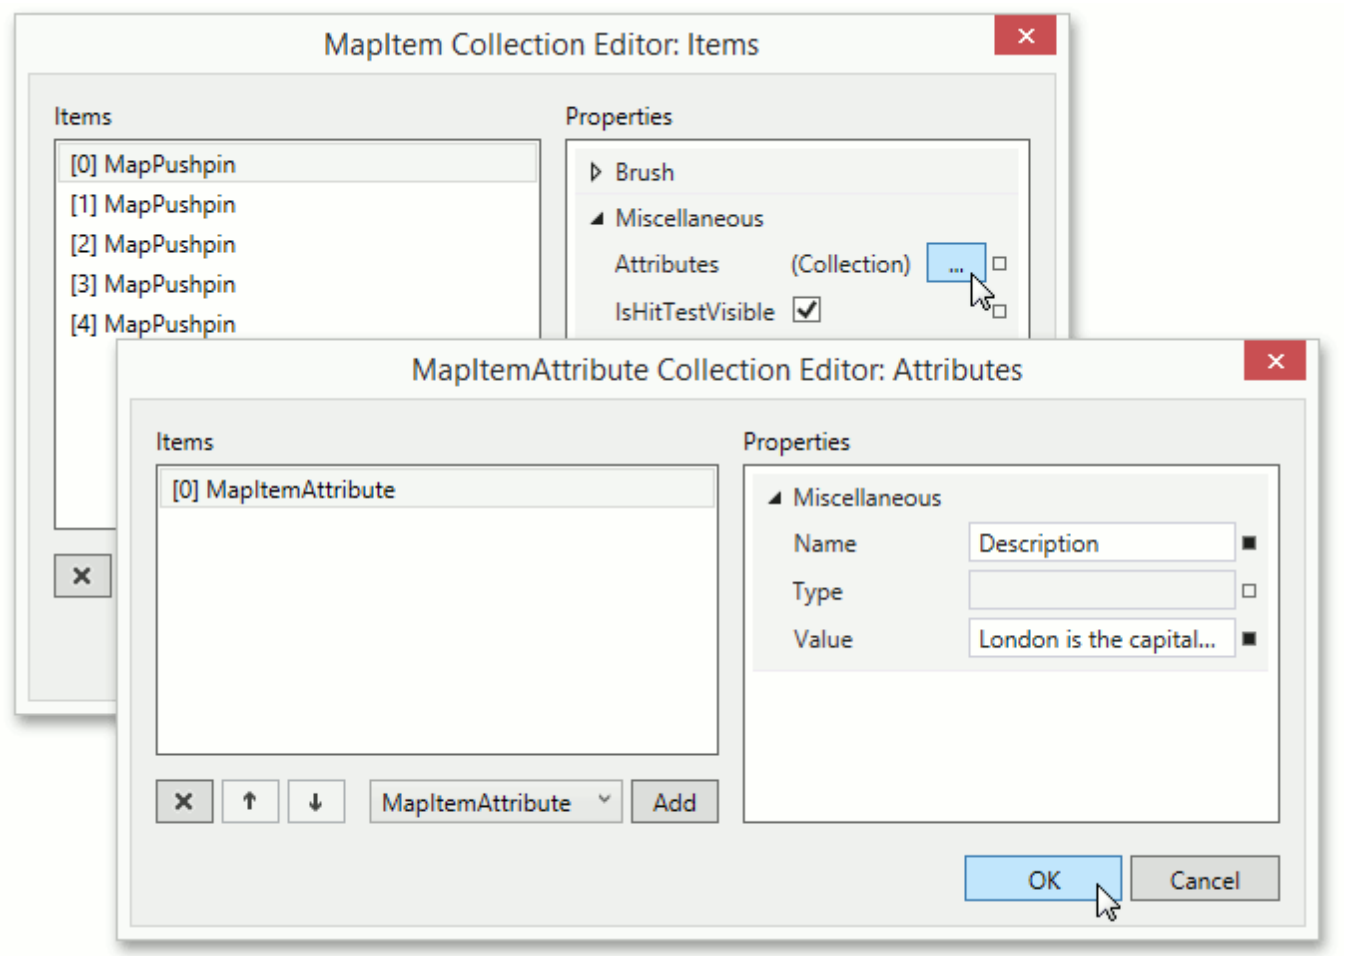
Attributes are used to associate a vector item with supplementary information. The Map Control operates with vector item attributes, allowing you to visualize any kind of data.

A single attribute is represented by the MapItemAttribute object. This object can be added to the MapItemAttributeCollection, returned by the MapItem.Attributes property of the MapItem class descendant.

These attributes can be specified in various ways, depending on the approach the Map Control utilizes to obtain vector items. The sections below describe each approach in detail, as well as how to use vector item attributes.

Manual creation of Vector Items

When vector items are created manually, you can also specify the attributes for any vector item.



To create an attribute:

- Create a MapItemAttribute object and add it to the MapItem.Attributes collection.
- Specify the attribute's MapItemAttribute.Name, MapItemAttribute.Type (optionally), and MapItemAttribute.Value.

The following code shows how this can be done for the Map Pushpin.

Xaml	

© 2018 Developer Express Inc.

```
<Map:MapPushpin ToolTipPattern="London">
    <Map:MapPushpin.Location>
        <Map:GeoPoint Latitude="51.507222" Longitude="-0.1275"/>
    </Map:MapPushpin.Location>
    <Map:MapPushpin.Attributes>
        <Map:MapItemAttribute Name="Name" Value="London"/>
        <Map:MapItemAttribute Name="Description" Value="London is the capital city of England and the Uni
    </Map:MapPushpin.Attributes>
</Map:MapPushpin>
```

Loading Vector Items from a Vector Format File

When the map control obtains vector items from a vector format file using ShapefileReader or KmlReader, vector item attributes are generated automatically. And for example, it is possible to use them in tooltips using braces to specify them.

Xaml

```
<Map:VectorFileLayer ToolTipPattern="{}{NAME}: ${GDP_MD_EST}M">
    <Map:ShapefileReader>
        <Map:MapPackageFileSource FileName="Countries.shp"/>
    </Map:ShapefileReader>
</Map:VectorFileLayer>
```

Map Area

Windows 10 App Controls > Controls > Map Control > Visual Elements > Map Area

The **Map Area** is a key element of Map Control. It is represented by a rectangle that displays map images and vector elements from all layers contained in a Map Control.

All other visual elements (e.g., navigation panel, color legend, etc.) are painted above the **Map Area**.

The following image demonstrates the **Map Area** without any other visual elements.

Below are the main properties that affect element appearance and functionality.

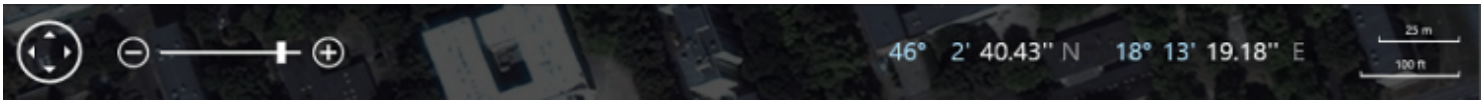
Size	The **Height** and **Width** properties of a MapControl.
Visibility	The **Visibility** property of a MapControl.

© 2018 Developer Express Inc.

Navigation Panel

Windows 10 App Controls > Controls > Map Control > Visual Elements > Navigation Panel

The **Navigation Panel** contains various UI elements that help end-users scroll and zoom the map area, as well as view the coordinates of the map points currently being hovered by a mouse pointer.



Below are the main properties that affect element appearance and functionality.

Availability	A NavigationPanelOptions object returned by the MapControl.NavigationPanelOptions property.
Position and Layout	NavigationPanelOptions.Location, NavigationPanelOptions.Orientation, NavigationPanelOptions.HorizontalAlignment, NavigationPanelOptions.VerticalAlignment
Elements	NavigationPanelOptions.ShowCoordinates, NavigationPanelOptions.ShowKilometersScale, NavigationPanelOptions.ShowMilesScale, NavigationPanelOptions.ShowScrollButtons, NavigationPanelOptions.ShowZoomTrackbar

© 2018 Developer Express Inc.

Vector Elements

This document describes how to draw different vector elements above the Map control and lists all supported types for these elements.

Vector Elements are displayed on a Map control by the VectorItemsLayer object.

The following types of vector elements are currently supported.

- MapDot
- MapEllipse
- MapLine
- MapPath
- MapPolygon
- MapPolyline
- MapPushpin
- MapRectangle
- MapShape
- MapCustomElement

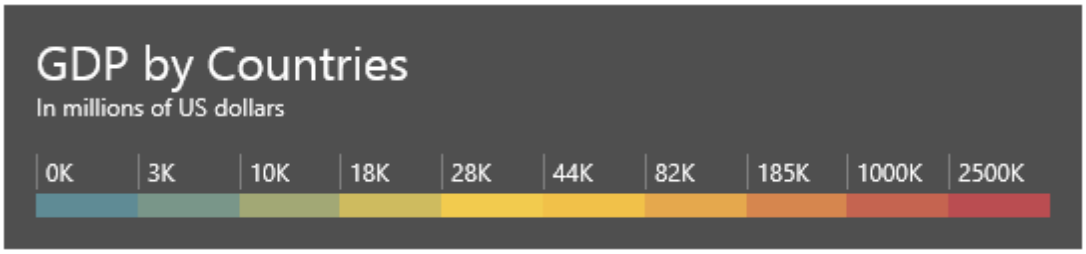
© 2018 Developer Express Inc.

Color Legend

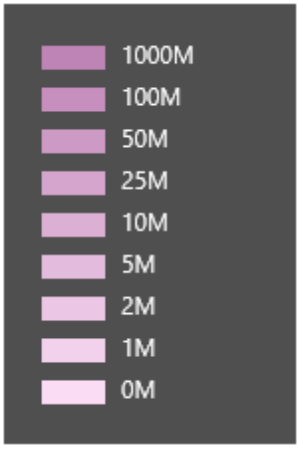
The **Color Legend** is a panel that shows information on what each color means when map shapes are colored by the Colorizer.

There are two types of color legends:

- **Color Scale**



- **Color List**



The type of the Color Legend is defined by the value of the ChoroplethColorizer.Legend property.

General

This section includes examples that demonstrate how to perform general actions with the map control.

- How to: Add a Map Control at Design Time
- How to: Add a Map Control via XAML
- How to: Add a Map Control via Code
- How to: Get a Bing Maps Key

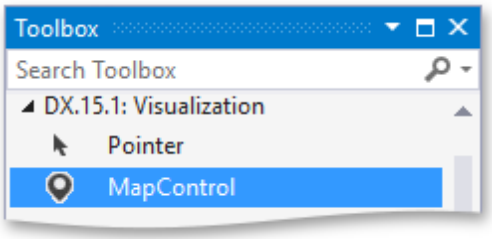
© 2018 Developer Express Inc.

How to: Add a Map Control at Design Time

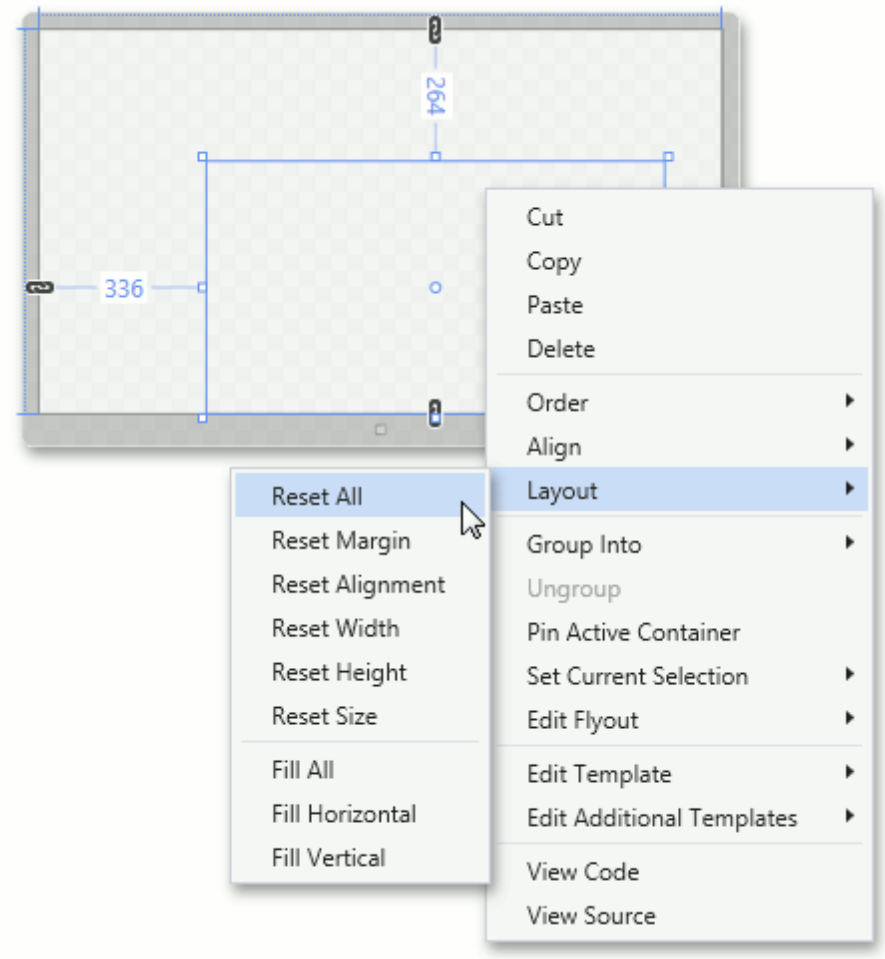
This short introductory example describes how to add a Map control to your Universal Windows application at design time within Visual Studio.

1. Run Microsoft Visual Studio 2015 or 2017.
2. Create a new project by selecting **FILE | New | Project** in the main menu. In the **New Project** window that is invoked, select **Windows Store | Blank App (Xaml)** and specify the project name.
3. Add the MapControl component to your project.

To do this, locate the **MapControl** item in the Toolbox under the **DX.18.1: Visualization** tab and drop it onto the form.



4. Right-click the map control and select the **Layout | Reset All** item in the context menu.



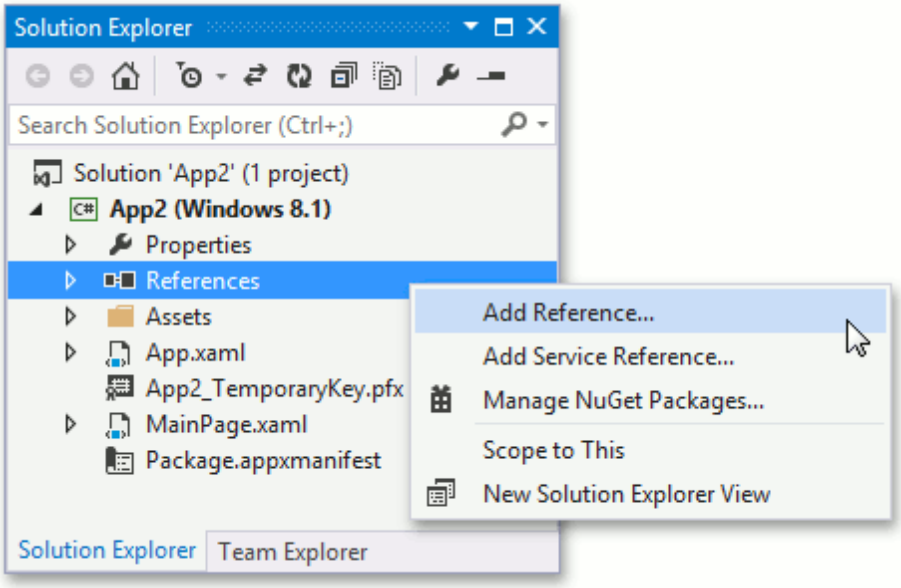
The MapControl has now been added to your application.

© 2018 Developer Express Inc.

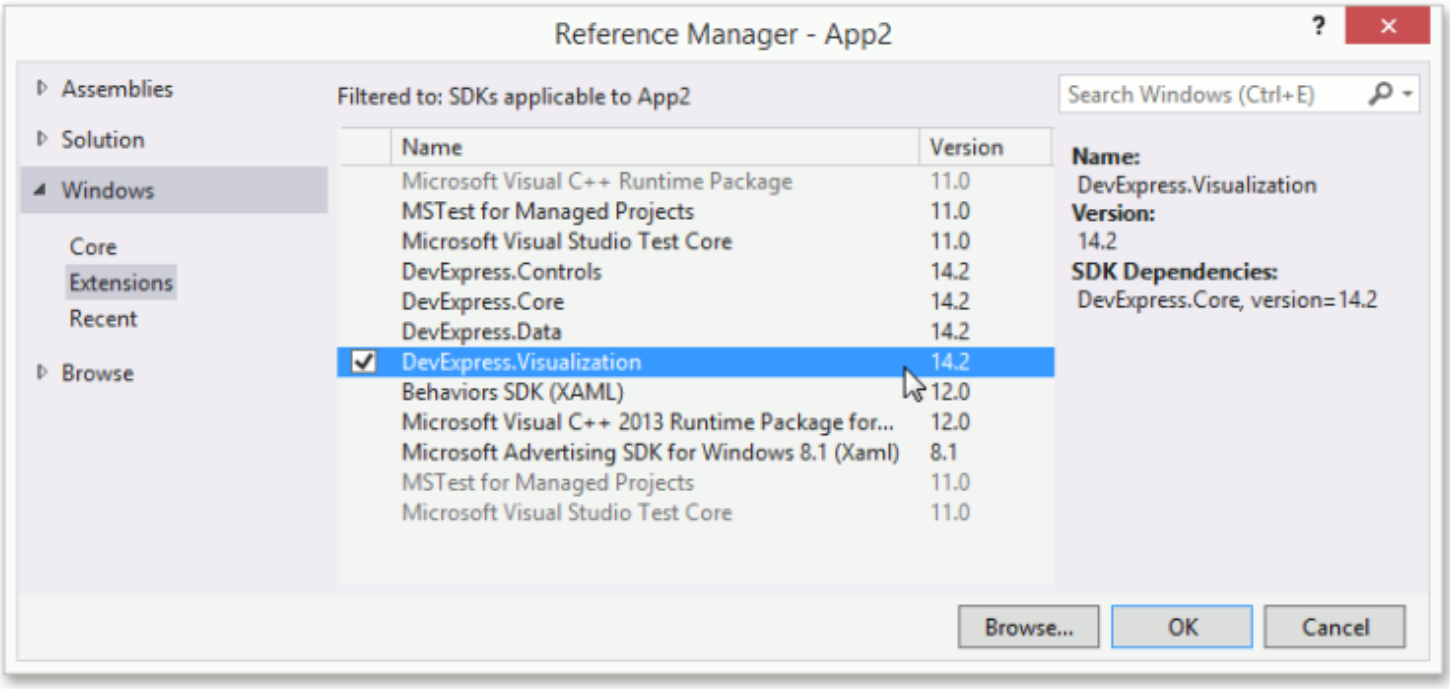
How to: Add a Map Control via XAML

This is a short introductory example, which describes how to add a Map Control to your Windows application in a XAML designer.

- Run MS Visual Studio 2015 or 2017.
- Create a new **Windows Store | Blank App (XAML)** project or open an existing one.
- Open the **Solution Explorer**, right-click **References** and choose **Add Reference...** to add the Map Control Library.



- Then, locate the **DevExpress.Visualization** assembly and click it.



Repeat this step to add the **DevExpress.Core** reference.
Click **OK** to apply changes and close the window.

- Switch to the XAML designer. And add a Map control to the window. For this, write the following XAML.

Xaml	

© 2018 Developer Express Inc.

```
<Page
    x:Class="App2.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:App2"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Map="using:DevExpress.UI.Xaml.Map"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Map:MapControl/>
    </Grid>
</Page>
```

The MapControl has been added to your application now.

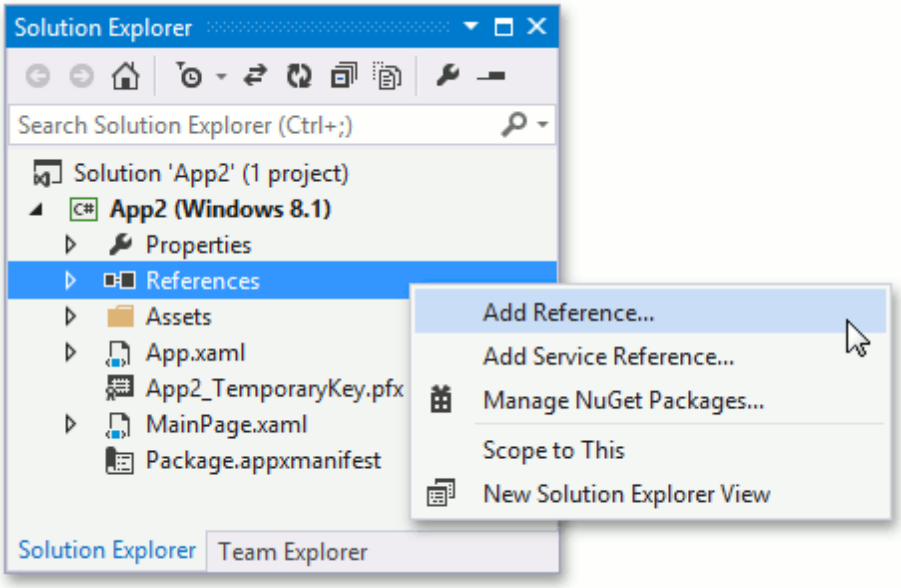
© 2018 Developer Express Inc.

How to: Add a Map Control via Code

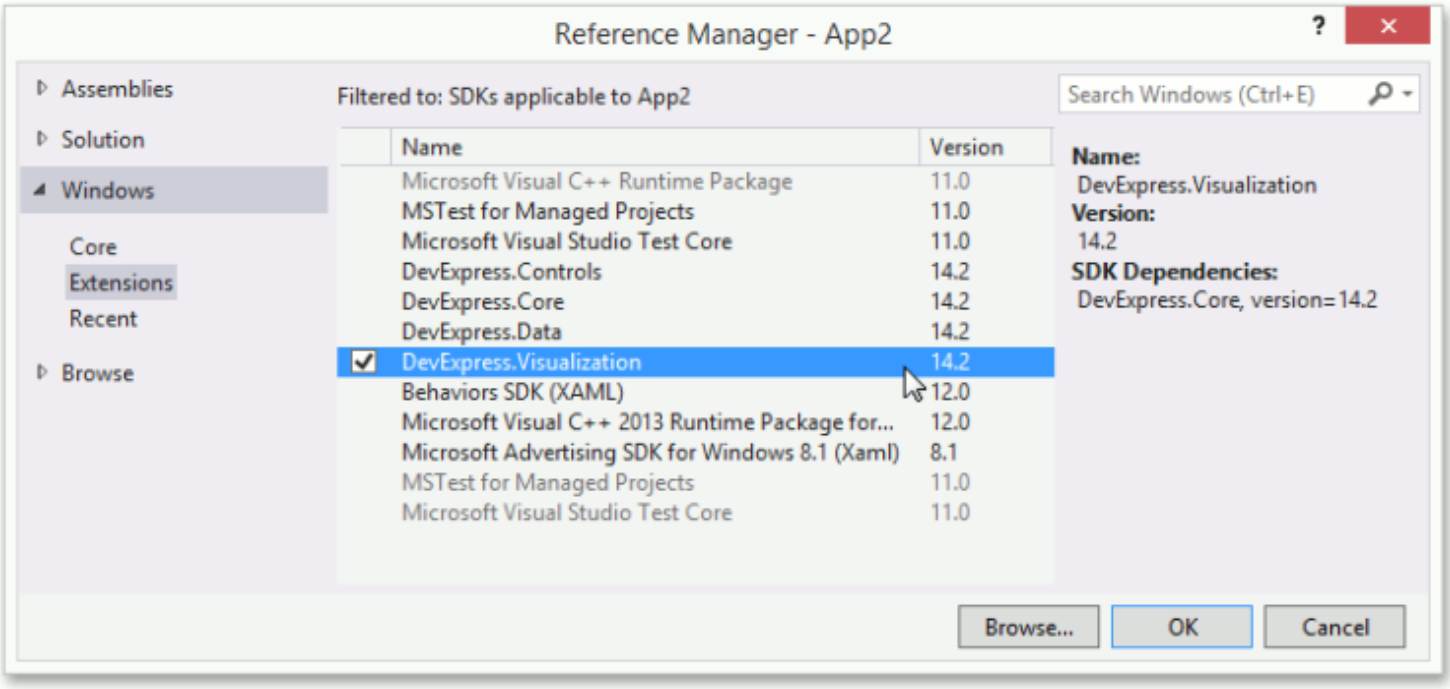
Windows 10 App Controls > Controls > Map Control > Examples > General > How to: Add a Map Control via Code

This is a short introductory example, which describes how to add a Map Control to your Windows application in a XAML designer.

- Run MS Visual Studio 2015 or 2017.
- Create a new **Windows Store | Blank App (XAML)** project or open an existing one.
- Open the **Solution Explorer**, right-click **References** and choose **Add Reference...** to add the Map Control Library.



- Then, locate the **DevExpress.Visualization** assembly and click it.



Repeat this step to add the **DevExpress.Core** reference.
Click **OK** to apply changes and close the window.

- Write the following (or similar) code.

C#	

© 2018 Developer Express Inc.

```
using DevExpress.UI.Xaml.Map;
using Windows.UI.Xaml.Controls;
namespace App2
{
    public sealed partial class MainPage : Page
    {
        public MainPage()
        {
            this.InitializeComponent();
            MapControl map = new MapControl();
            this.Content = map;
        }
    }
}
```

Visual Basic

```
Imports DevExpress.UI.Xaml.Map
Public NotInheritable Class MainPage
    Inherits Page
    Public Sub New()
        Me.InitializeComponent()
        Dim map As New MapControl()
        Me.Content = map
    End Sub
End Class
```

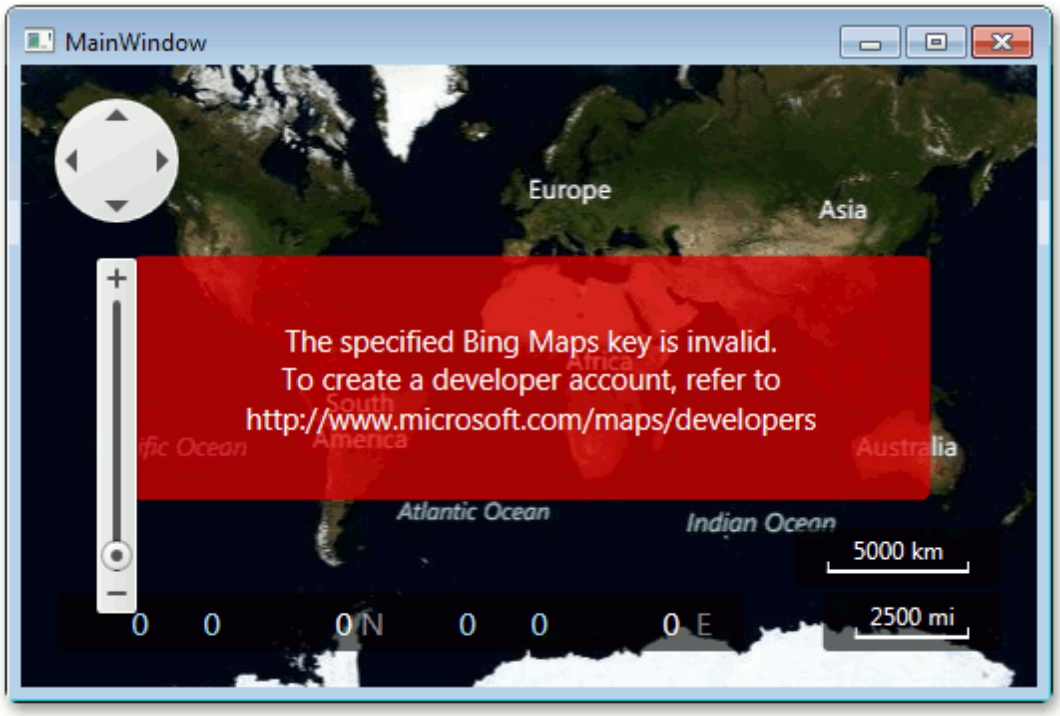
The MapControl has been added to your application now.

© 2018 Developer Express Inc.

How to: Get a Bing Maps Key

This document describes how to register a **Bing Maps** account and create a key for it to use in your map application.

If you connect your MapControl to Bing Maps via the BingMapDataProvider and don't specify the valid Bing Maps key, you will get the following error.



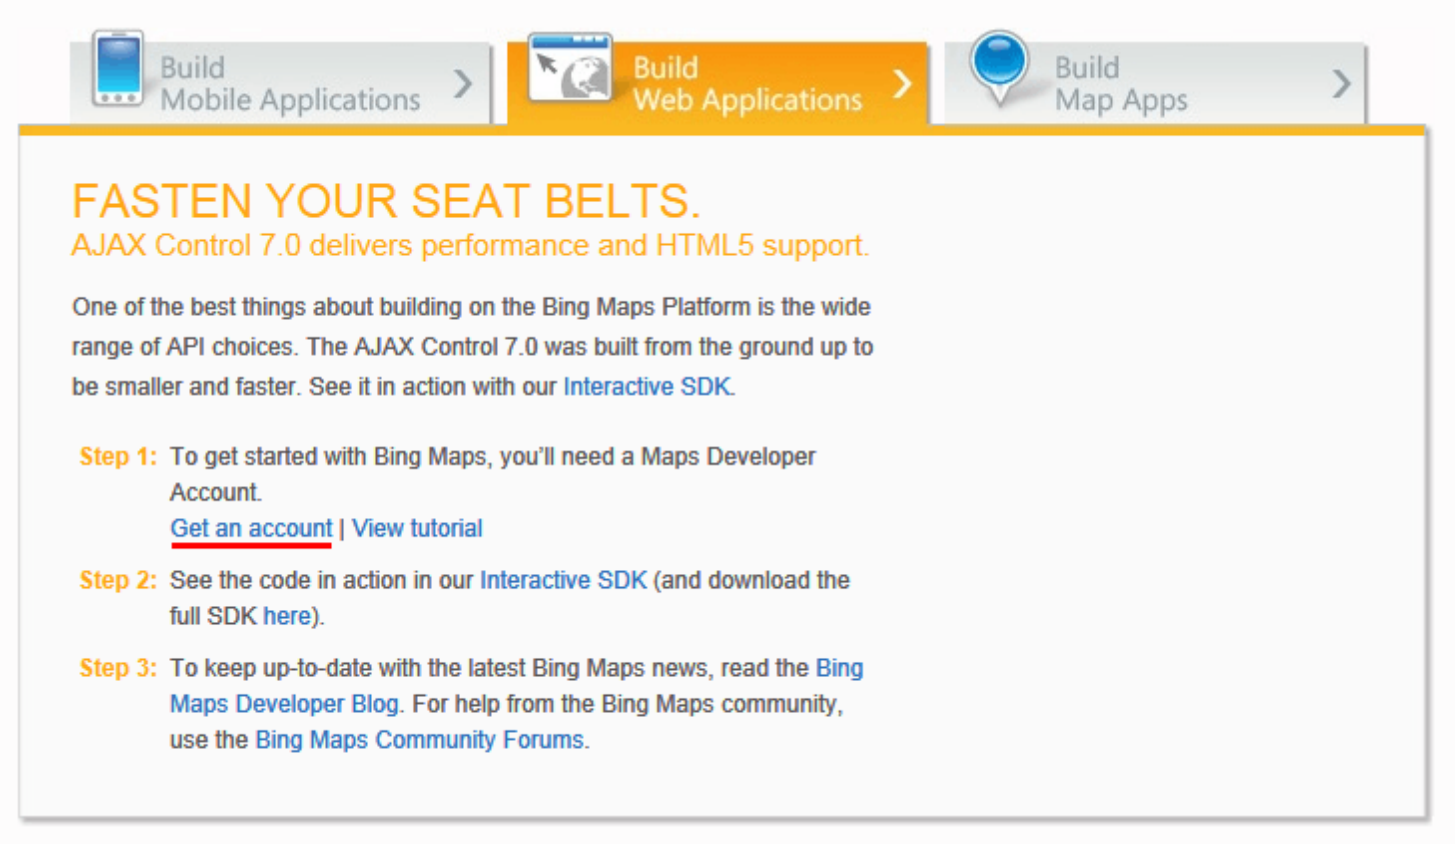
The error message suggests for you to visit the official Microsoft web page devoted to Bing Maps. This page contains links to web resources, which are useful for map application developers; the page also suggests that you create a new account and get a developer key for it.

- Open this web page in your favorite web browser:

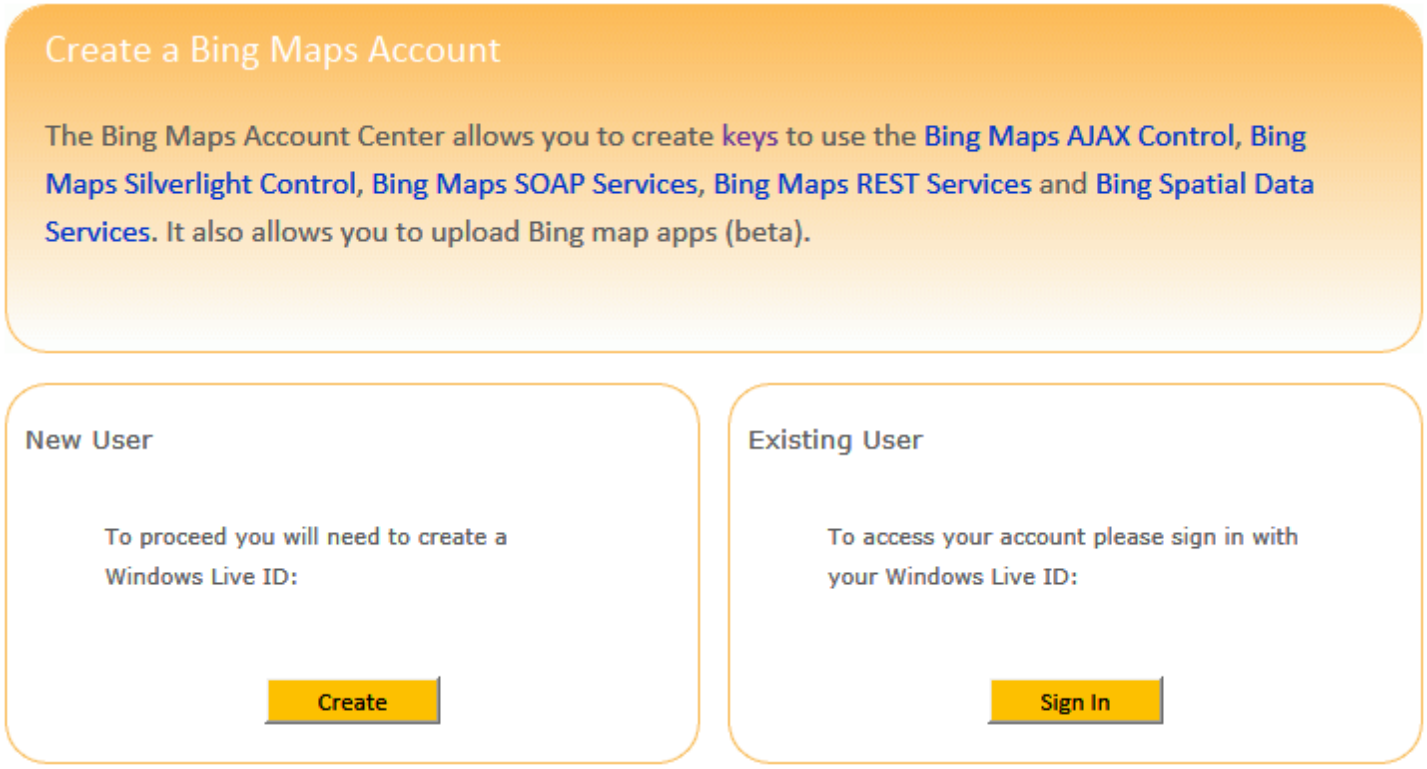
Bing Maps Developer Resources: Map SDKs, APIs, Tips, Training

- On this page, click the **Create an account** link as follows.

© 2018 Developer Express Inc.

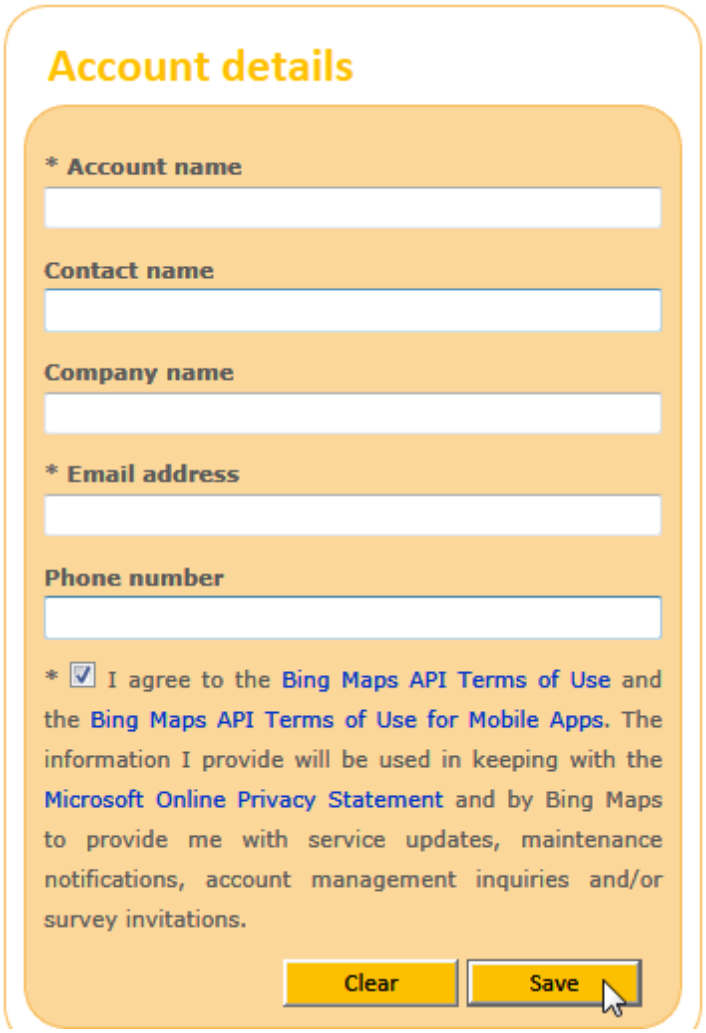


- After that you will be redirected to the Bing Maps Account Center. Choose either the **Create** or **Sign In** option, depending on what you need to do to create a new Bing Maps account.



- After that, fill in your account details and click **Save**.

© 2018 Developer Express Inc.



- Now you've registered a Bing Maps account and are ready to create a Bing Maps key for it. To do this, click **Create or view keys**.

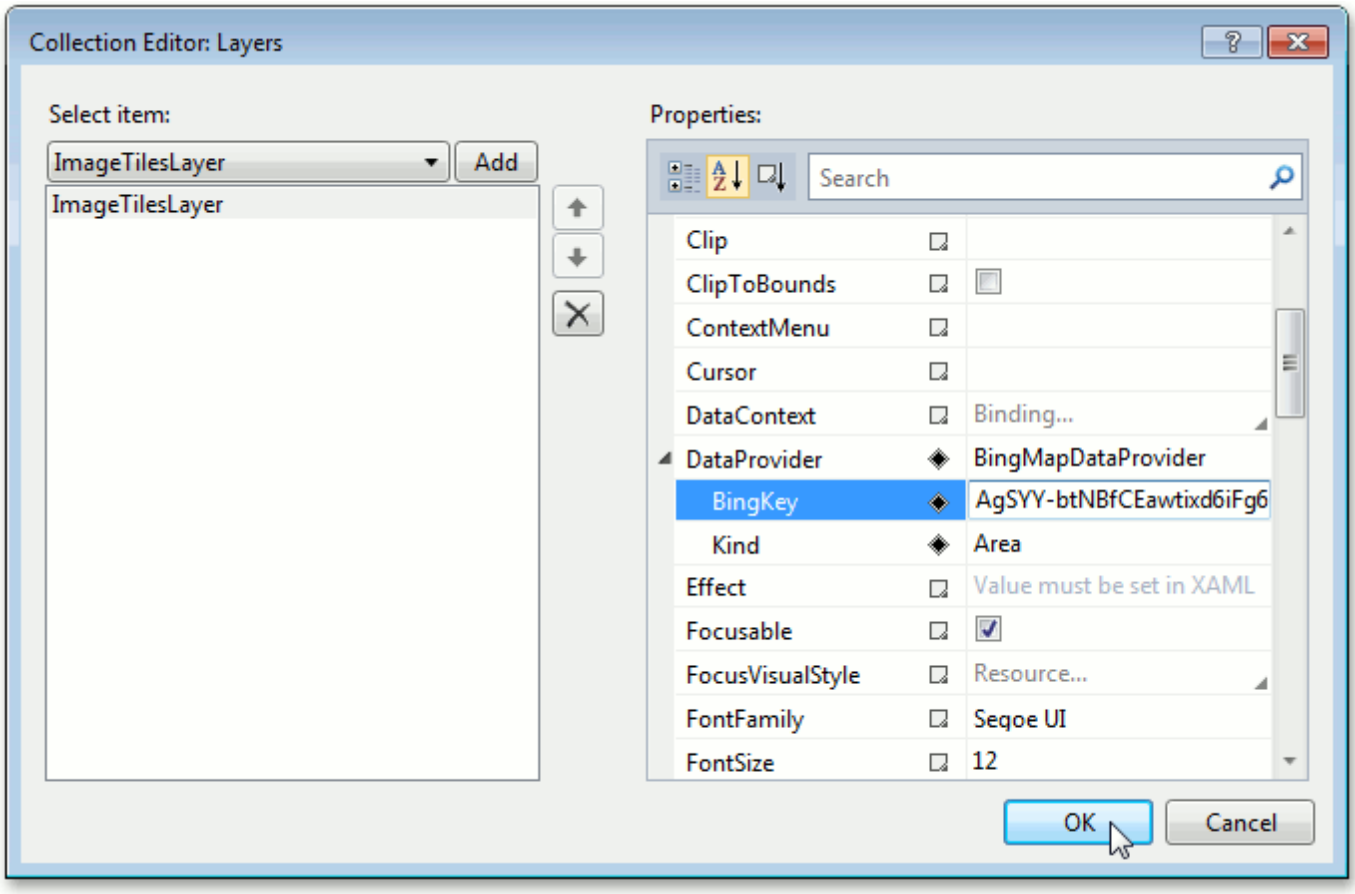
How to get your Bing Maps Key
Note: It is the first item under
Developer Tutorials

- Now you should decide what Bing Maps key you require for your application. For more information on this, refer to the Getting a Bing Maps Key topic in MSDN, and also review Microsoft Bing Maps Platform APIs' Terms of Use.
- After you get your Bing Maps key, you should assign it to the BingMapDataProvider.BingKey property.



© 2018 Developer Express Inc.

That's all. For more information on using the **Bing Maps** service, please refer to the corresponding section in MSDN: Bing Maps.

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T191718.	

To bind a vector item source to map control, do the following.

- Create a VectorItemsLayer object and add it to the MapControl.Layers collection.
- Assign the vector item source to the VectorItemsLayer.ItemsSource property of the object.

Xaml

Vector Data from Shapefile

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279980.	

To load vector data from a Shapefile, do the following.

- Create a VectorFileLayer object and add it to the MapControl.Layers collection.
- Create an instance of the ShapefileReader class and assign the instance to the VectorFileLayer.FileReader property.
- Create a MapFileSourceBase class descendant object, configure it and assign it to the MapFileReaderBase.FileSource property of the instance.

Xaml

```
 (MainPage.xaml)
<Map:VectorFileLayer
    ShapeStroke="{ThemeResource AppBarBackgroundThemeBrush}">
    <Map:ShapefileReader>
        <Map:ShapefileReader.FileSource>
            <Map:MapPackageFileSource FileName="Assets\Countries.shp"/>
        </Map:ShapefileReader.FileSource>
    </Map:ShapefileReader>
</Map:VectorFileLayer>
```

Windows 10 App Controls > Controls > Map Control > Examples > Vector Data > Providing Data > How to: Load Vector Data from a KML File

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279977.	

To load vector data from a KML file, do the following.

- Create a VectorFileLayer object and add it to the MapControl.Layers collection.
- Create an instance of the KmlReader class and assign the instance to the VectorFileLayer.FileReader property.
- Create a MapFileSourceBase class descendant object, configure it and assign it to the MapFileReaderBase.FileSource property of the instance.

Xaml

```
 (MainPage.xaml)
<Map:VectorFileLayer
    ShapeStroke="{ThemeResource ApplicationPageBackgroundThemeBrush}">
    <Map:KmlReader>
        <Map:KmlReader.FileSource>
            <Map:MapPackageFileSource
                FileName="Assets\States.kml"/>
        </Map:KmlReader.FileSource>
    </Map:KmlReader>
</Map:VectorFileLayer>
```

Colorize Data

Windows 10 App Controls > Controls > Map Control > Examples > Vector Data > Colorize Data

This section includes examples that demonstrate how to colorize vector items.

- How to: Create a Political Map Using Graph Colorizer
- How to: Create an Analytical Map Using Choropleth Colorizer

See Also
Providing Data
Projections

Windows 10 App Controls > Controls > Map Control > Examples > Vector Data > Colorize Data > How to: Create a Political Map Using Graph Colorizer

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T279977.	

To create a political map, it is necessary to use the GraphColorizer class. Perform the following steps to create the map.

- Provide a required vector map to map control. (To learn how to do this, refer to Providing Data).
- Create an GraphColorizer object and assign it to the MapControl.Colorizer property.
- Specify the MapColorizer.Colors collection of the colorizer.

Xaml

```
 (MainPage.xaml)
<Map:MapControl.Colorizer>
    <Map:GraphColorizer>
        <Map:GraphColorizer.Colors>
            <Color>#5b9bd5</Color>
            <Color>#ed7d31</Color>
            <Color>#a5a5a5</Color>
            <Color>#ffc000</Color>
            <Color>#4472c4</Color>
            <Color>#70ad47</Color>
        </Map:GraphColorizer.Colors>
    </Map:GraphColorizer>
</Map:MapControl.Colorizer>
```

Projections

This section includes examples that demonstrate how to customize the map projections.

- How to: Customize the Cylindrical Equal-Area Projection

See Also
Providing Data
Colorize Data

Windows 10 App Controls > Controls > Map Control > Examples > Vector Data > Projections > How to: Customize the Cylindrical Equal-Area Projection

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T196064.	

To customize equal-area projection, do the following.

- Set an EqualAreaProjection object to the MapItemsLayerBase.MapProjection property of a vector data layer.
- Specify its Width/Height ratio. To do this, assign this ratio based size to the MapItemsLayerBase.InitialMapSize property of the vector data layer.

Xaml

```
 (MainPage.xaml)
<Page xmlns:Map="using:DevExpress.UI.Xaml.Map"

Overview

This suite contains two gauge controls - the CircularGauge and the LinearGauge.

Circular Gauge

The Circular Gauge control is intended for creating arc speedometers, tachometers, stopwatches, clocks, etc., and provides the following features.

Circular Gauge elements

- Arc Scale
- Circular Gauge Layer

Arc Scale elements

- Arc Scale Layer
- Arc Scale Line
- Spindle Cap
- Major Tickmarks
- Minor Tickmarks
- Arc Scale Labels
- Arc Scale Needle
- Arc Scale Marker
- Arc Scale Range Bar
- Arc Scale Ranges

Linear Gauge

The Linear Gauge control is intended for creating linear thermometers, indicators, etc., and provides the following features.

Linear Gauge elements

- Linear Gauge Layer
- Linear Scale

Linear Scale elements

- Linear Scale Layer
- Linear Scale Line
- Major Tickmarks
- Minor Tickmarks
- Linear Scale Labels
- Linear Scale Needle
- Linear Scale Marker
- Linear Scale Range Bar
- Linear Scale Ranges

© 2018 Developer Express Inc.

Getting Started

Topics in this section:

- Lesson 1 - Creating a Circular Gauge
- Lesson 2 - Creating a Linear Gauge

© 2018 Developer Express Inc.

Lesson 1 - Creating a Circular Gauge

This is the first tutorial in the Gauges Getting Started series. It will guide you through the process of creating a Circular Gauge and adjusting its common settings.

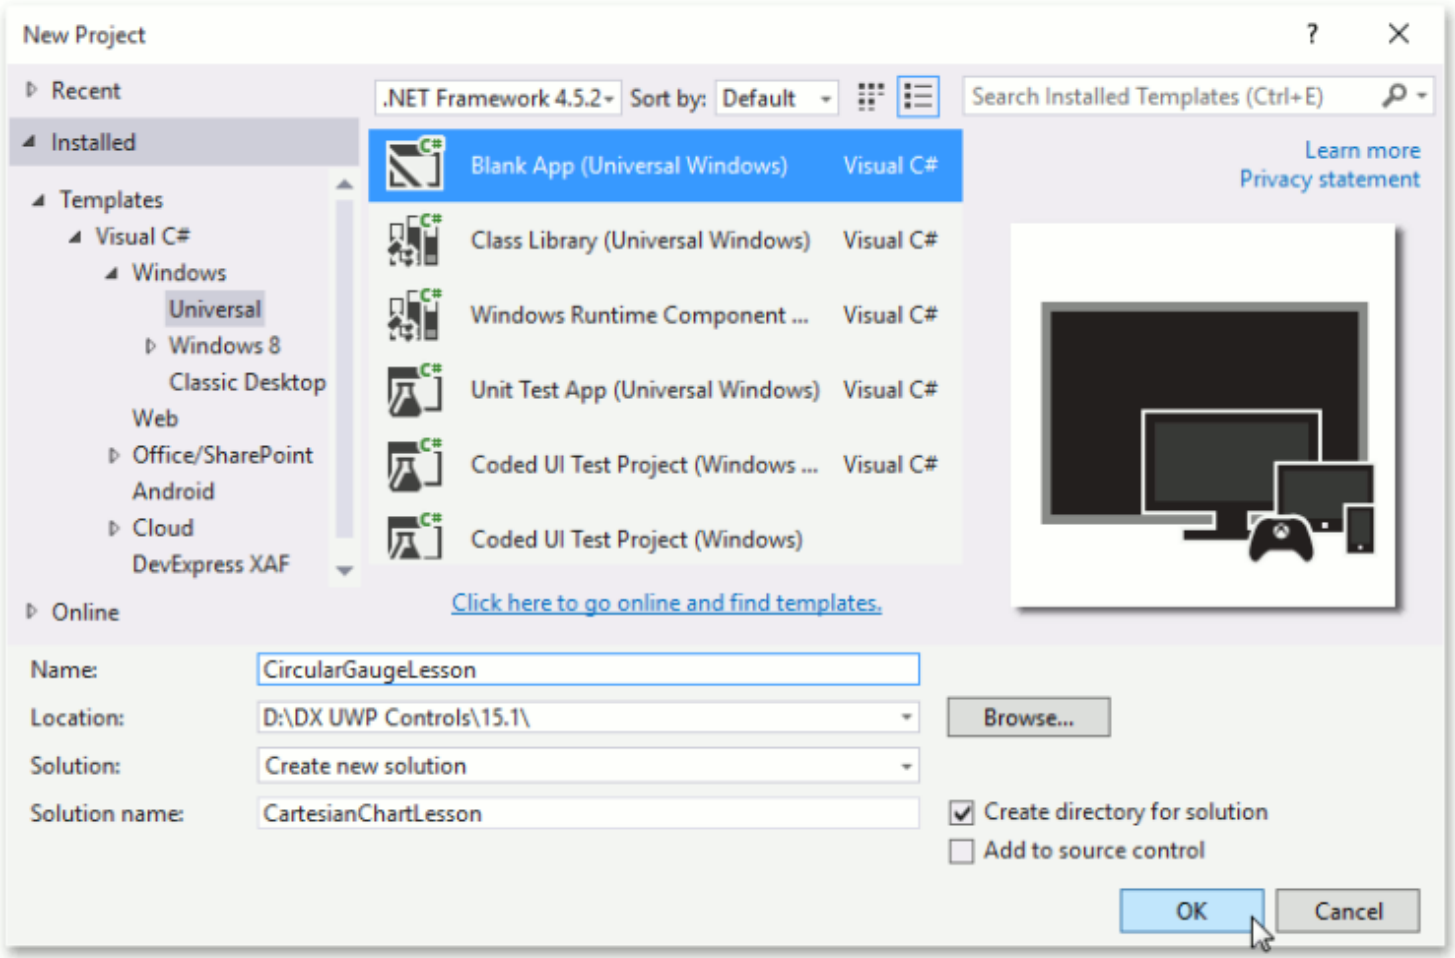
This tutorial consists of the following steps:

- Step 1. Create a New Project and Add a Circular Gauge Control
- Step 2. Add a Scale
- Step 3. Add Value Indicators
- Result

Step 1. Create a New Project and Add a Circular Gauge Control

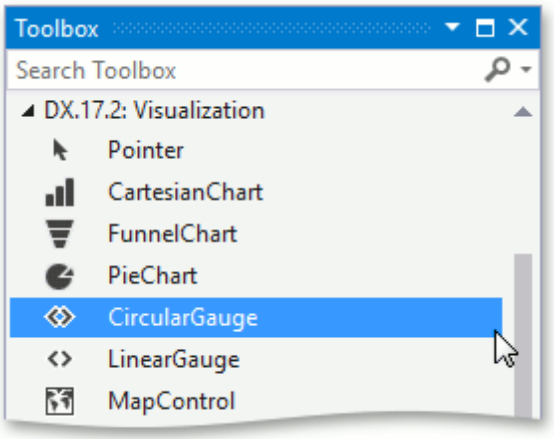
- Run MS Visual Studio 2015 or 2017.
- Create a new Universal Windows Platform application by selecting **New Project** from the **File** menu or by pressing **Ctrl+Shift+N**. Next, select **Windows| Universal** and choose **Blank App (Universal Windows)**.

Name this application "CircularGaugeLesson" and click OK.



- Switch to the **MainPage.xaml** design view and add the CircularGauge control to the main page by dragging and dropping the **CircularGauge** item from the **DX.18.1: Visualization** toolbox tab.

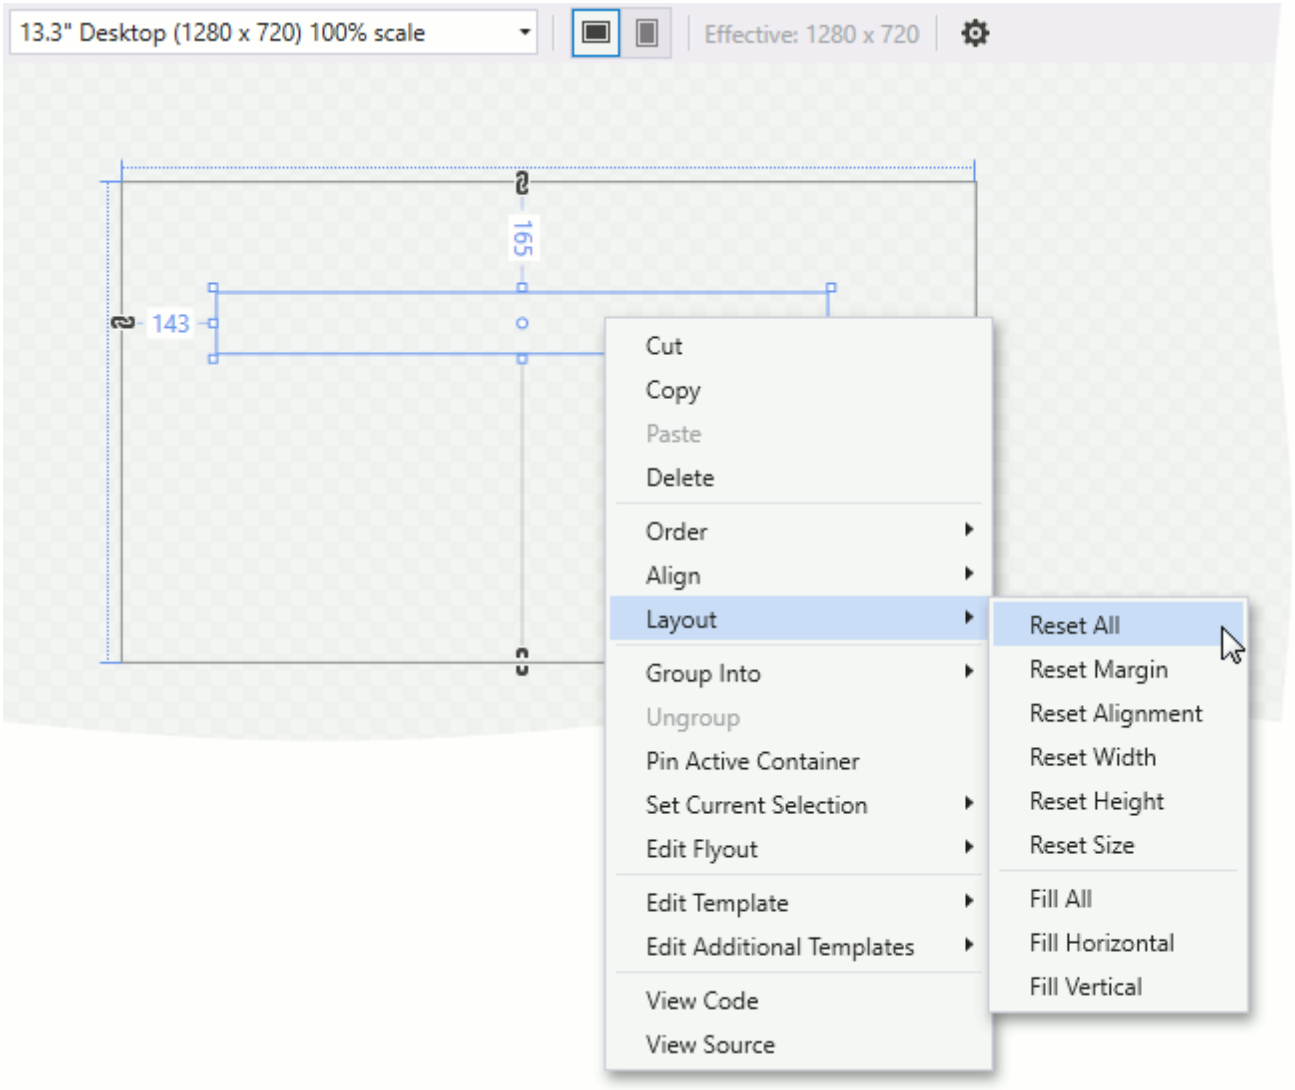
© 2018 Developer Express Inc.



Note

The following SDK extensions will be added to the References list in your project: *DevExpress.Core* and *DevExpress.Visualization*.

- Right-click the **CircularGauge** object and choose the **Reset Layout | All** option in the context menu. This will stretch the gauge to fill the entire window.



Your XAML should look like the following. If it doesn't, you can overwrite your code as follows:

© 2018 Developer Express Inc.

Xaml

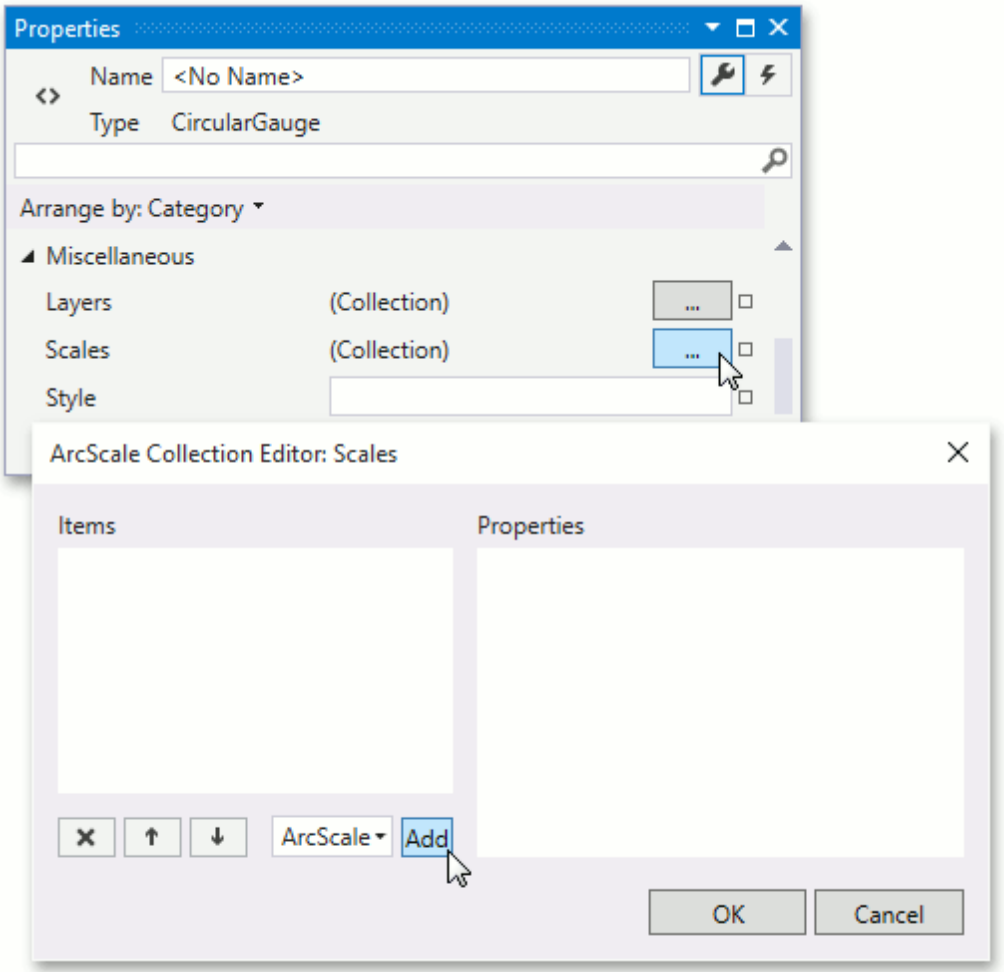
```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Gauges="using:DevExpress.UI.Xaml.Gauges"
    x:Class="CircularGaugeLesson.MainPage">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Gauges:CircularGauge/>
    </Grid>
</Page>
```

Step 2. Add a Scale

Scales are the main elements of a Gauge control because they contain all other visual elements. The Gauge control can consist of multiple scales, each with an independent set of elements and options, and all scales are stored in the CircularGauge.Scales collection.

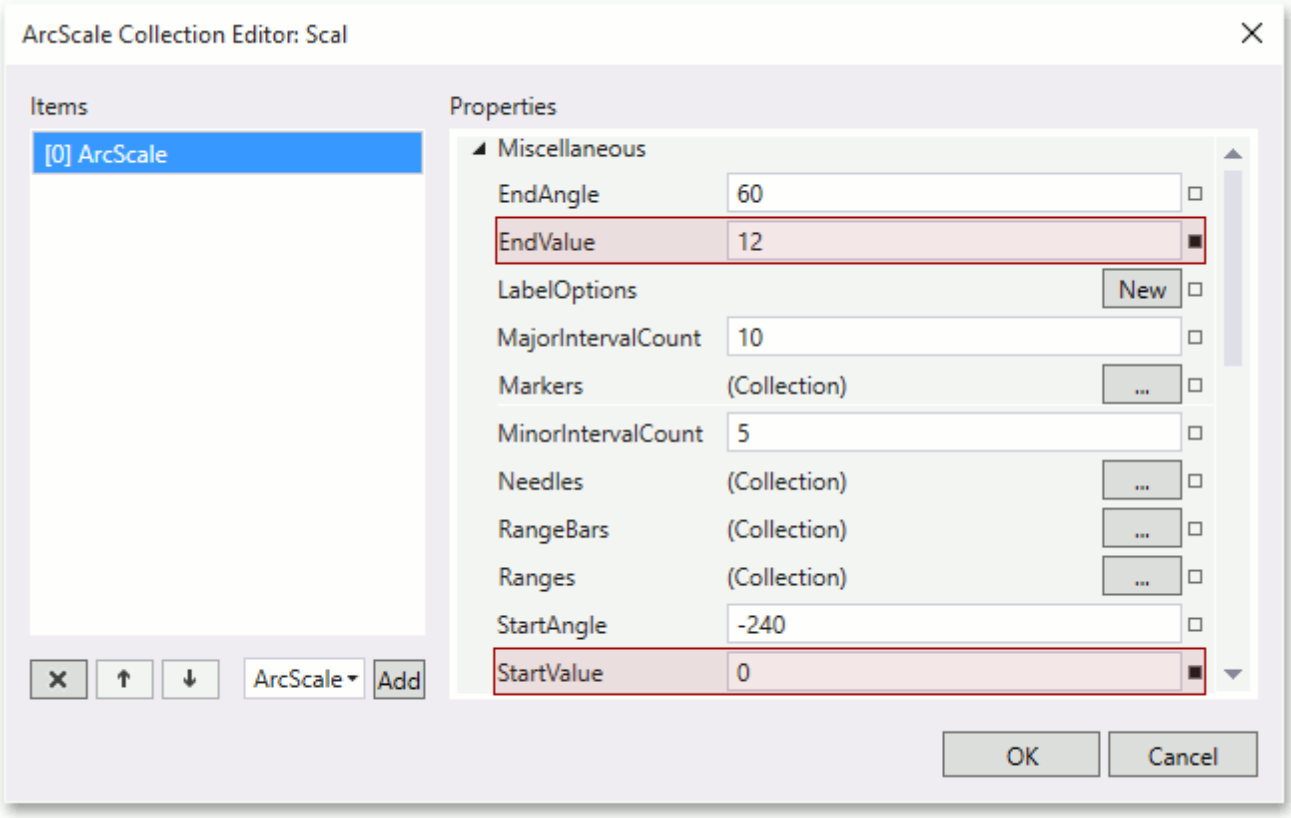
In this lesson, you only need to add one scale for demonstration purposes.

- To add a scale, locate the CircularGauge.Scales property in the **Properties** window and click the ellipsis button to invoke the Scales collection editor. In this editor, add a new ArcScale object using the **Add** button.

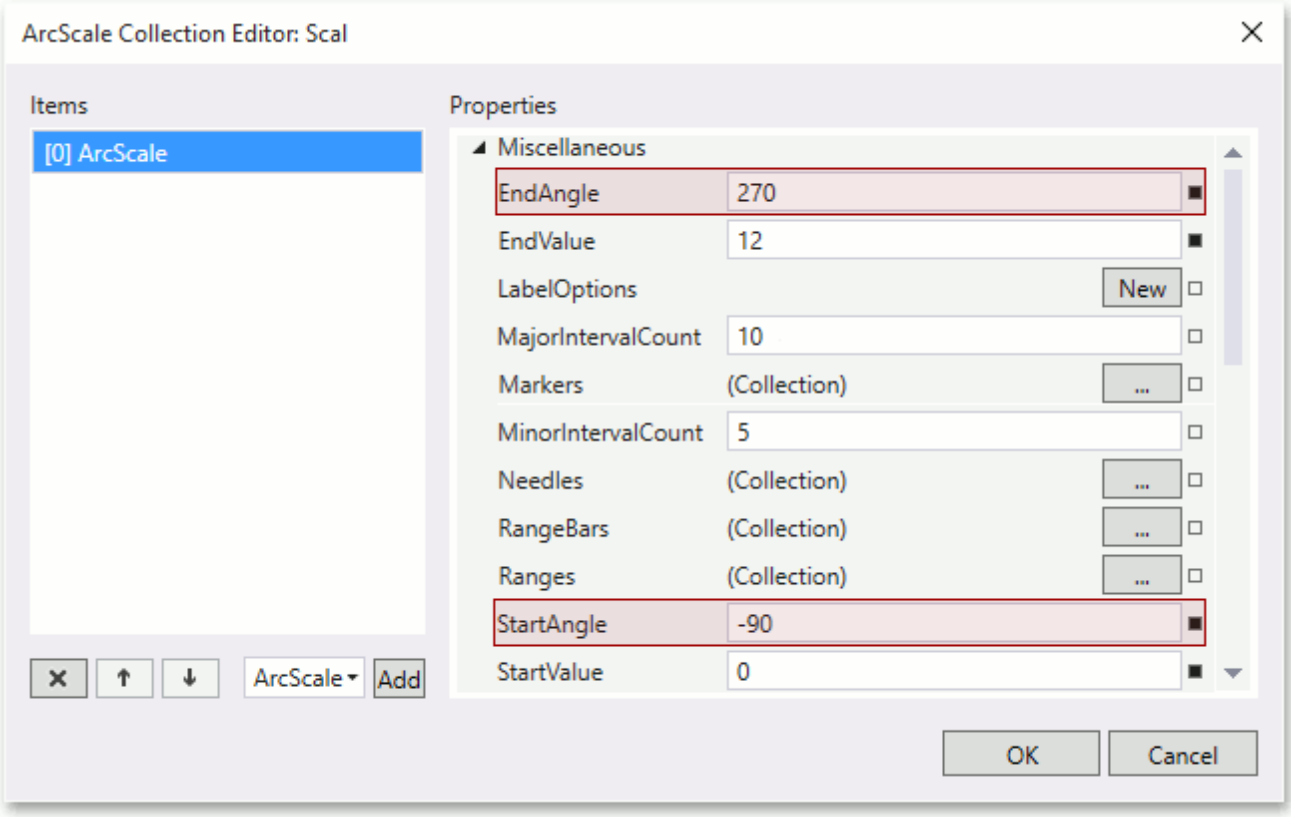


- Set Scale.StartValue to **0** and Scale.EndValue to **12** to count its values from 0 to 12, similar to the hours of an actual clock.

© 2018 Developer Express Inc.

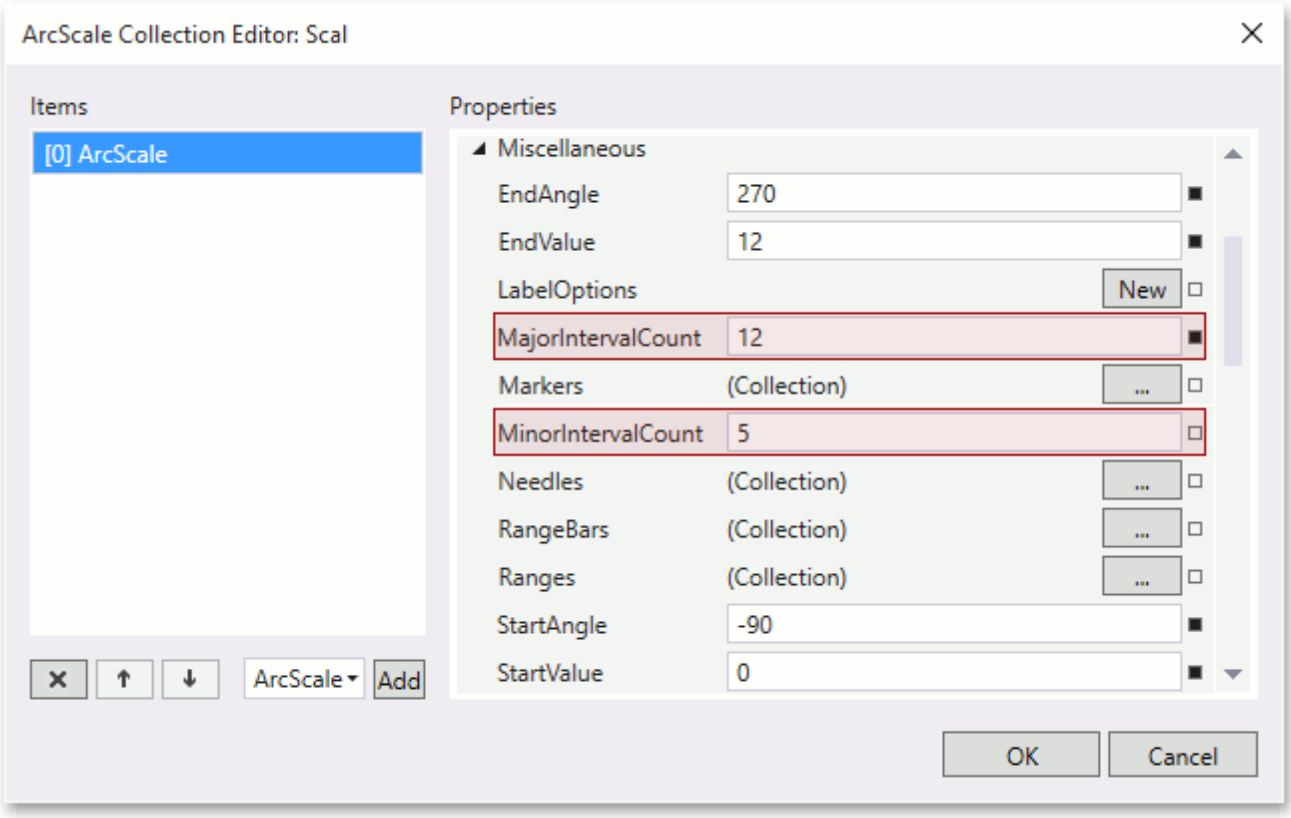


- Set ArcScale.StartAngle to **-90** and ArcScale.EndAngle to **270** to close the Circular scale and make it similar to an actual clock.

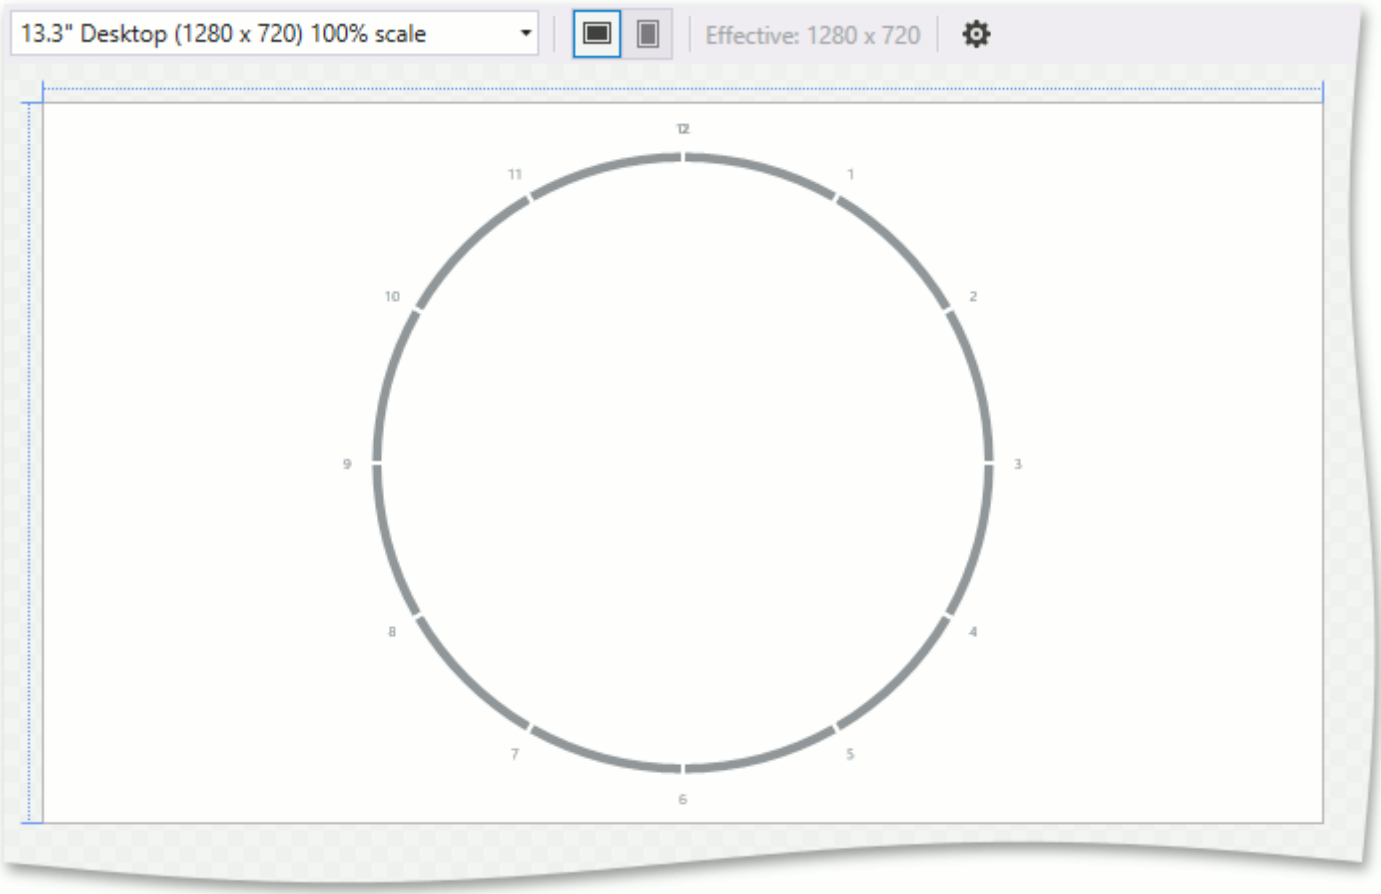


- Set Scale.MajorIntervalCount to **12** and Scale.MinorIntervalCount to **5** to show a total of **12** hour ticks and **5** minute ticks in each hour tick.

© 2018 Developer Express Inc.

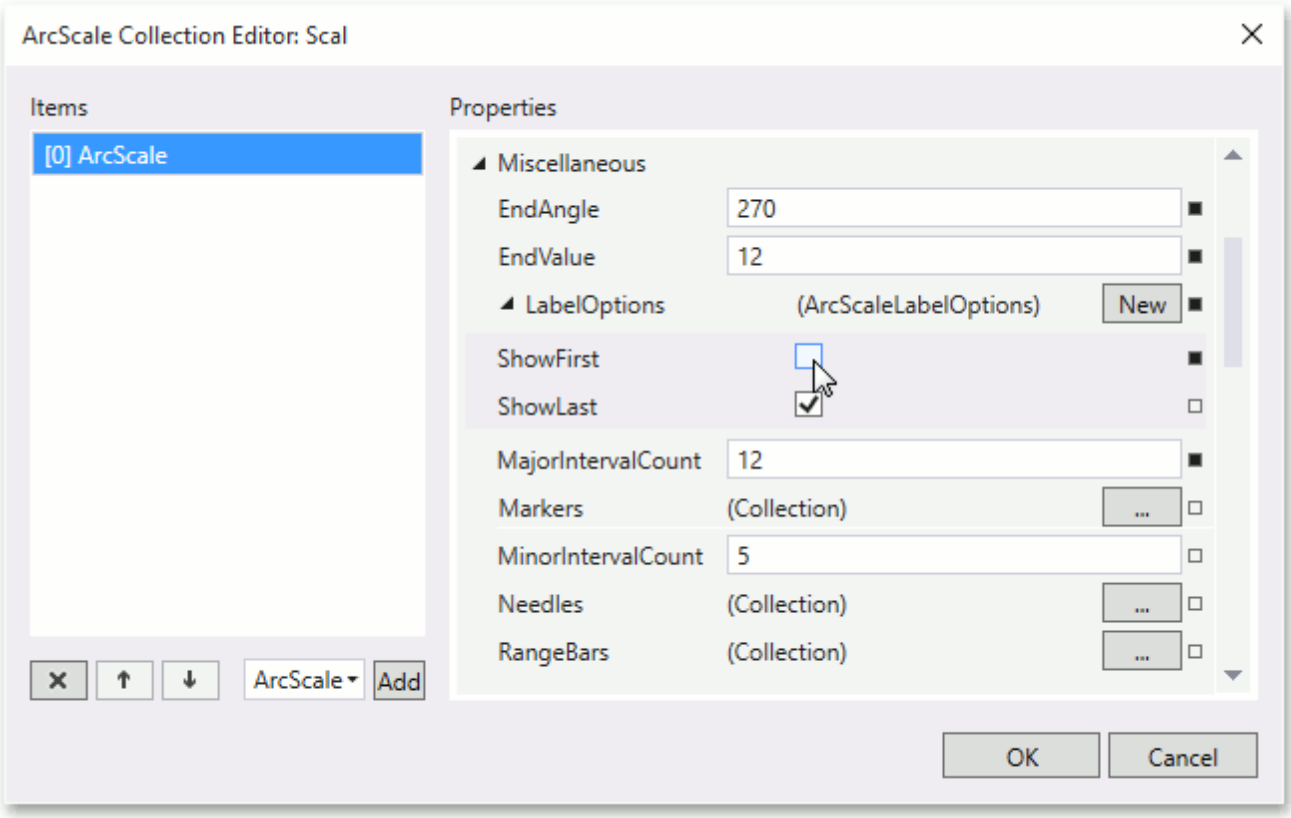


- The Gauge control should look as shown in the image below.



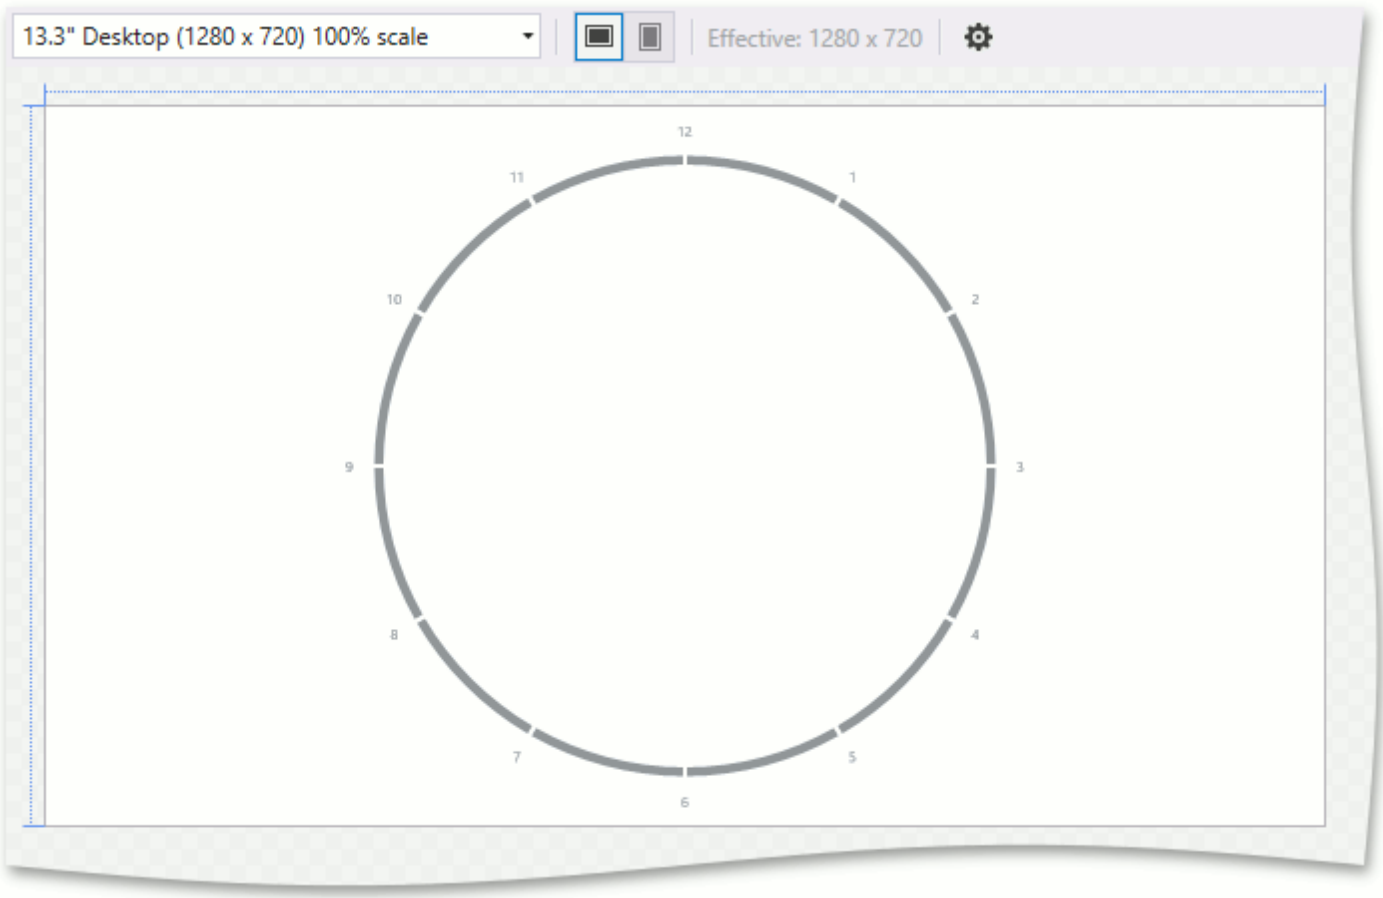
© 2018 Developer Express Inc.

Note, that the start value and end value are shown in the same place. To improve the gauge appearance, set the ScaleLabelOptions.ShowFirst property to **False**.



After performing these actions the gauge should look like this.

© 2018 Developer Express Inc.



Note
The appearance of a Gauge control can be customized using various options. For instance, you can control the visibility of different scale elements via the ArcScale.ShowSpindleCap, Scale.ShowMajorTickmarks, Scale.ShowMinorTickmarks, Scale.ShowLabels and Scale.ShowLine properties.

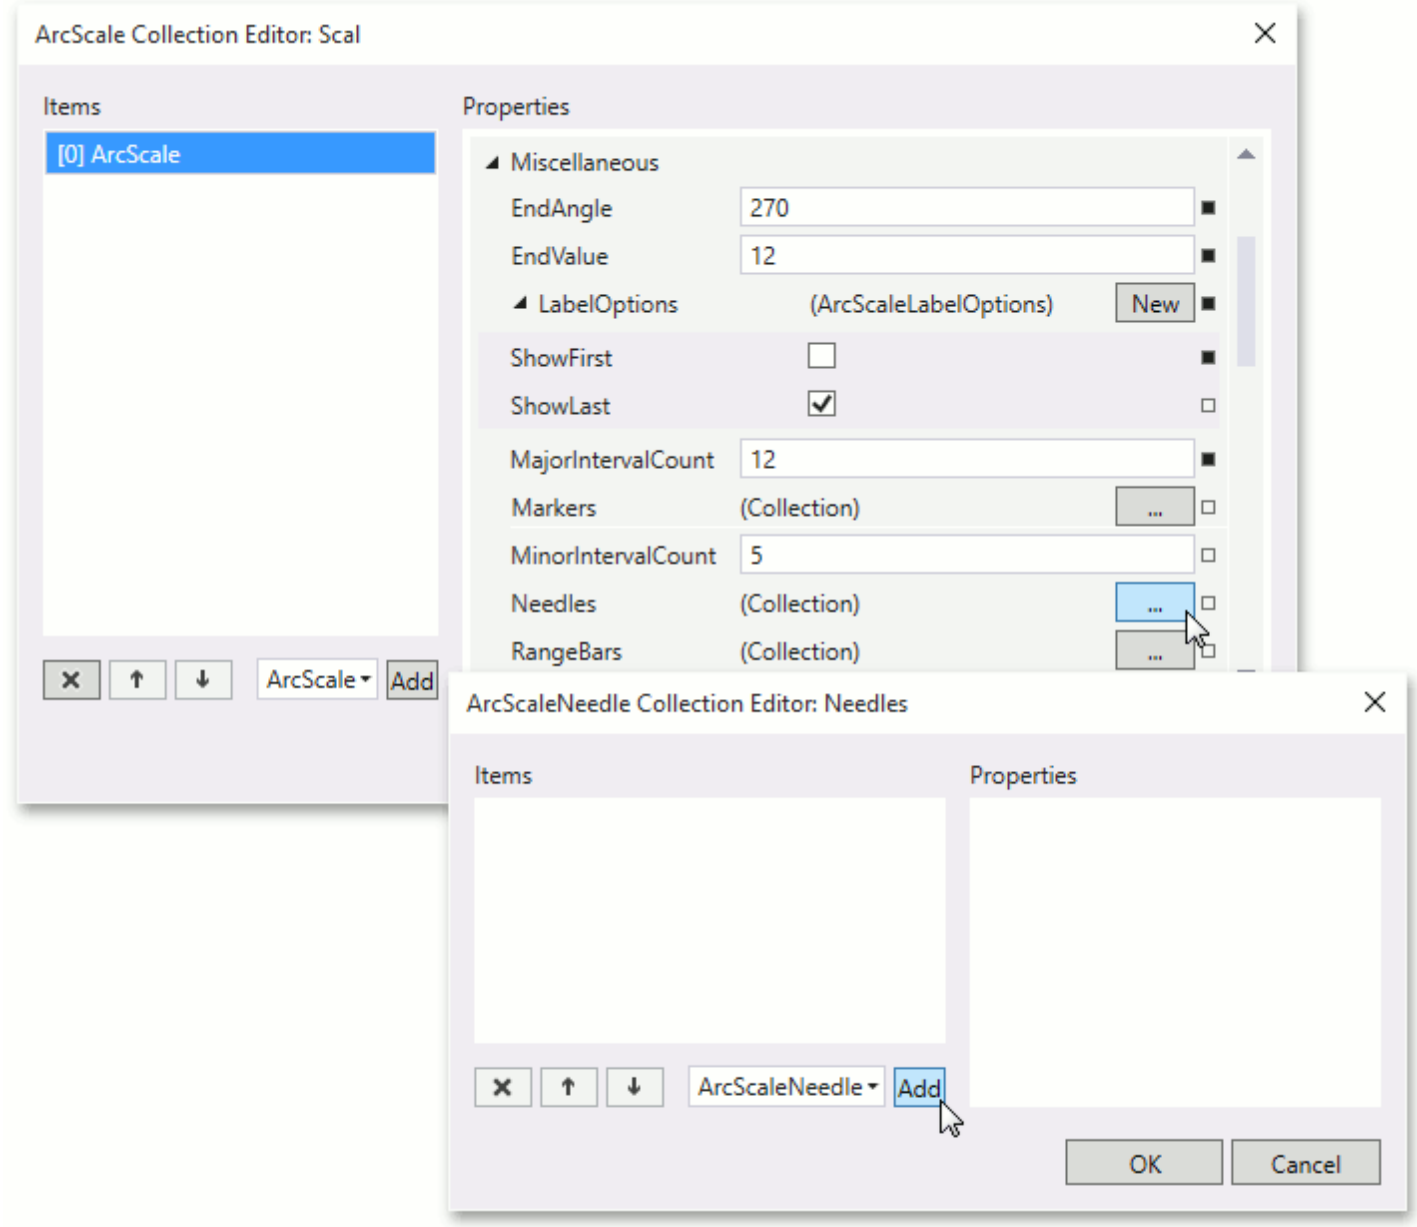
Step 3. Add Value Indicators

In this step, you can add basic elements that visually represent current values on a Circular scale. In most cases, Circular scales support three indicator types: Needles, Markers and Range Bars.

- Add a Needle element that will indicate the current measurement value (e.g. the current time in *hours*).

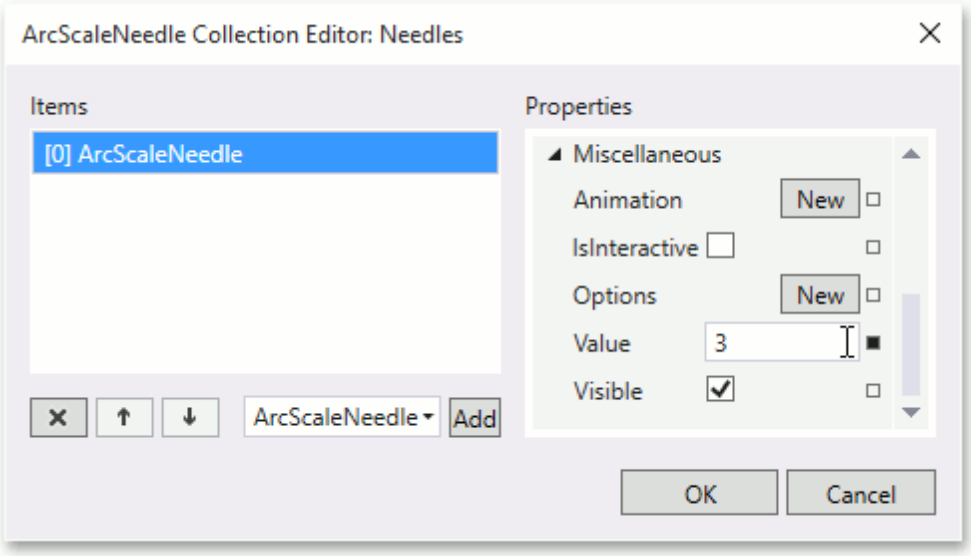
To do this, locate the ArcScale.Needles property of the arc scale that was added in the previous step, invoke the Needles collection editor and click **Add**.

© 2018 Developer Express Inc.



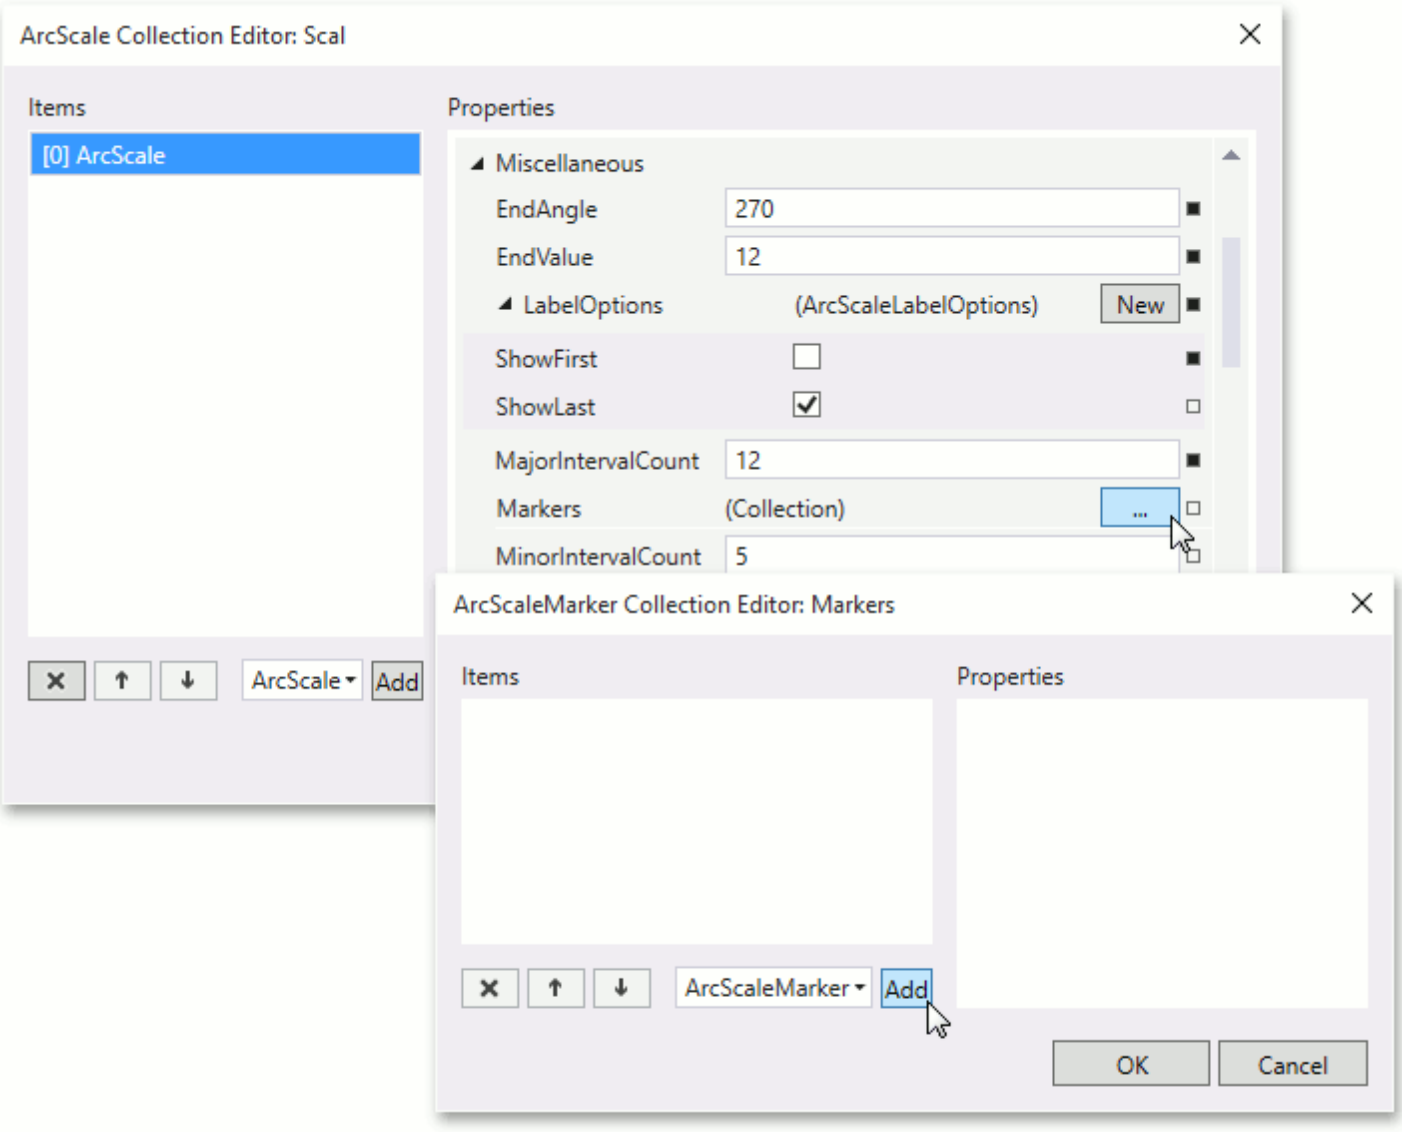
Then set the ValueIndicatorBase.Value property of the newly created ArcScaleNeedle object to **3**.

© 2018 Developer Express Inc.



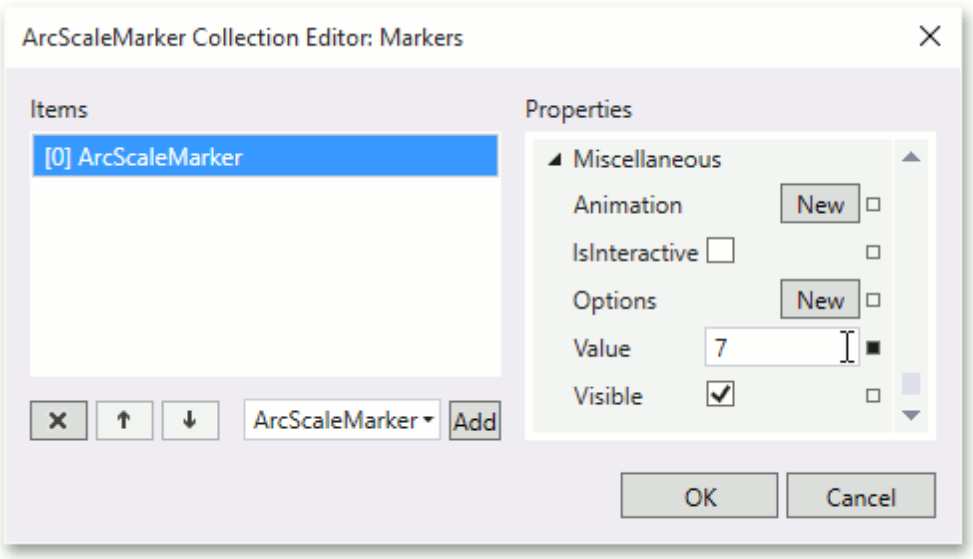
- Add one more needle to our clock to show *minutes* and set its ValueIndicatorBase.Value property to **12**.
- Add a Marker that will indicate any "fixed" value on a scale (e.g., an alarm that should ring at **7:00**).

To do this, locate the ArcScale.Markers property, invoke the Markers collection editor and click **Add**.



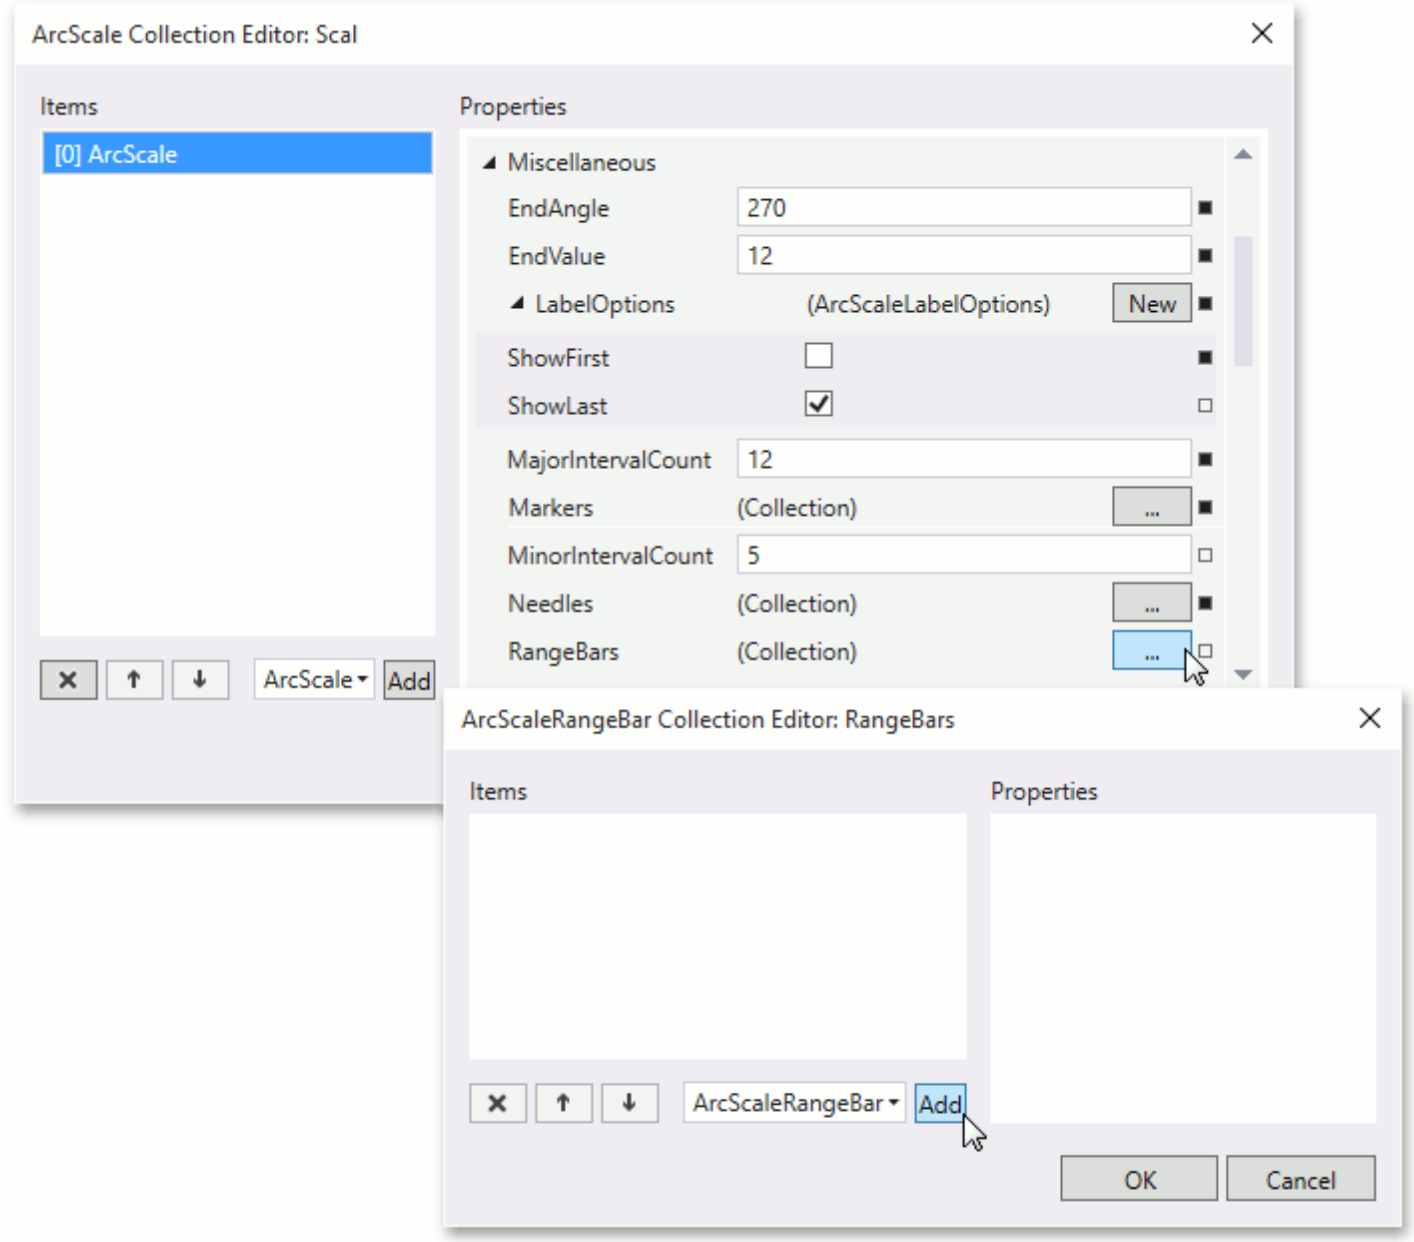
© 2018 Developer Express Inc.

Then set the ValueIndicatorBase.Value property of the newly created ArcScaleMarker object to **7**.



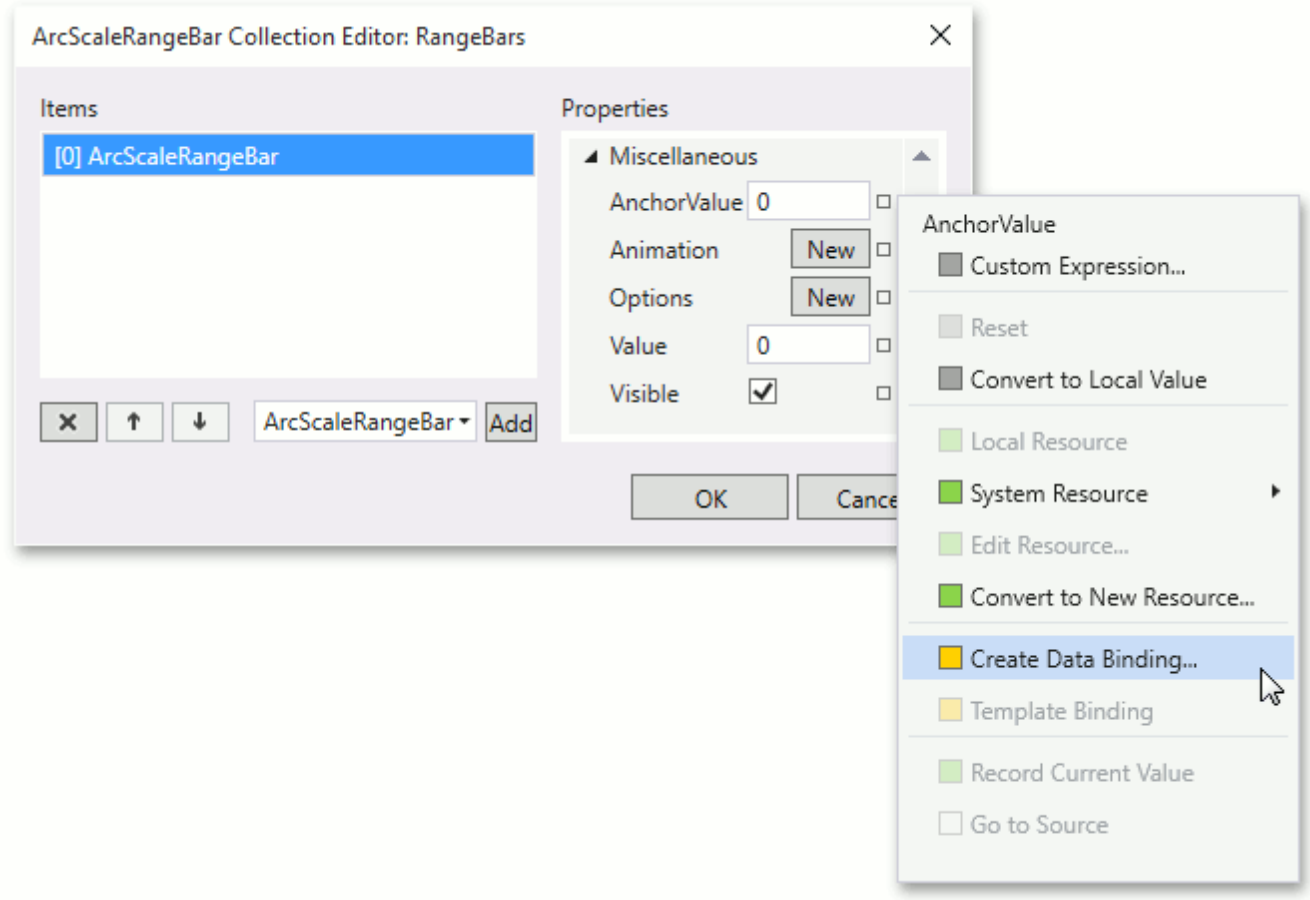
- Now add a Range Bar that will indicate the difference between any "anchored" value and the current value.

To do this, locate the ArcScale.RangeBars property, invoke the RangeBars collection editor and click **Add**.

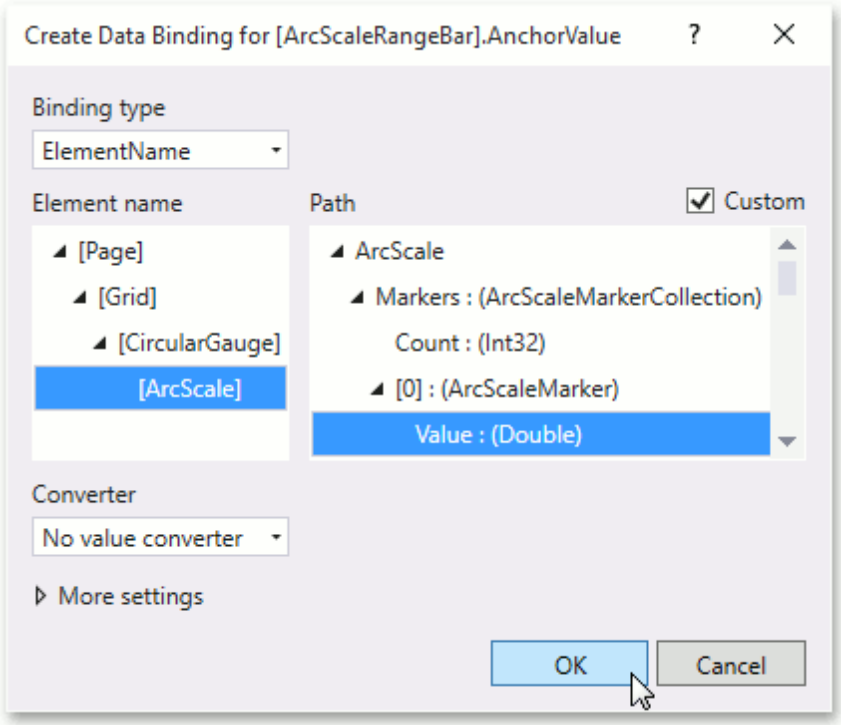


Then, bind the ArcScaleRangeBar.AnchorValue property of the newly created ArcScaleRangeBar object to the ValueIndicatorBase.Valueproperty of the previously added ArcScaleMarker. To do this, click the property marker and select **Create Data Binding...** item.

© 2018 Developer Express Inc.

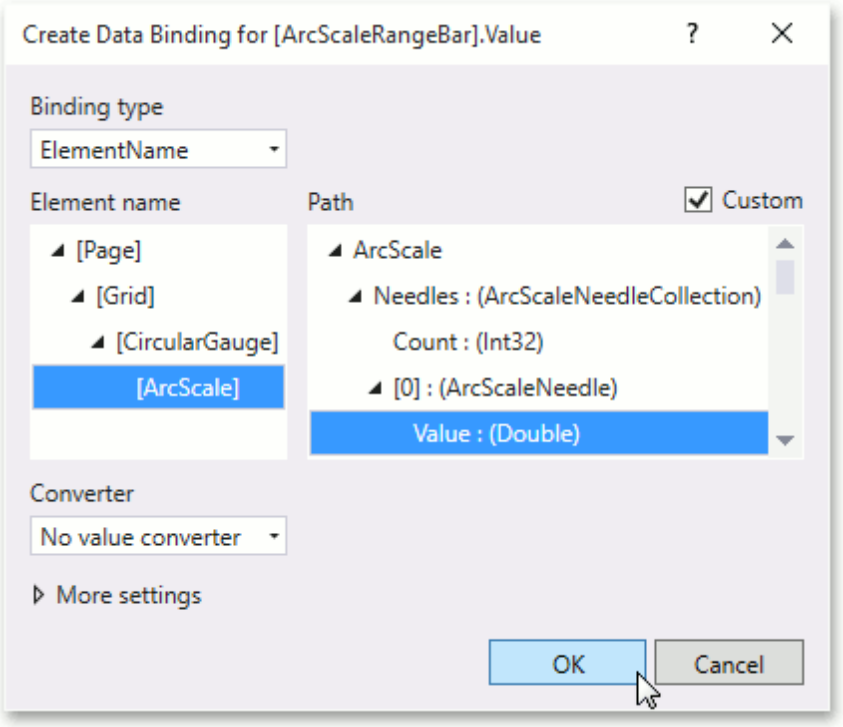


In the invoked **Data Binding Editor** select the **Value** property of the Marker.



Bind the ValueIndicatorBase.Value property to the ValueIndicatorBase.Value of the first added needle. To do this, click the property marker, then select the **Create Data Binding...** item. In the invoked editor, select the **Value** property of the needle.

© 2018 Developer Express Inc.



Result

Now our gauge application is ready. Your XAML should appear as follows.

Lesson 2 - Creating a Linear Gauge

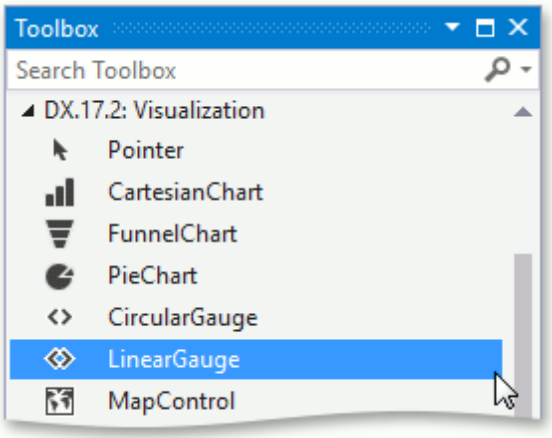
This is the second tutorial in the Gauges Getting Started series. It will guide you through the process of creating a Linear Gauge and adjusting its common settings.

This tutorial consists of the following steps:

- Step 1. Create a New Project and Add a Linear Gauge Control
- Step 2. Add a Scale
- Step 3. Add Value Indicators
- Step 4. Add Ranges
- Result

Step 1. Create a New Project and Add a Circular Gauge Control

Run MS Visual Studio 2015 or 2017, create a new Universal Windows Platform application. Switch to the **MainPage.xaml** design view and add the LinearGauge control to the main page by dragging and dropping the **LinearGauge** item from the **DX.18.1: Visualization** toolbox tab.

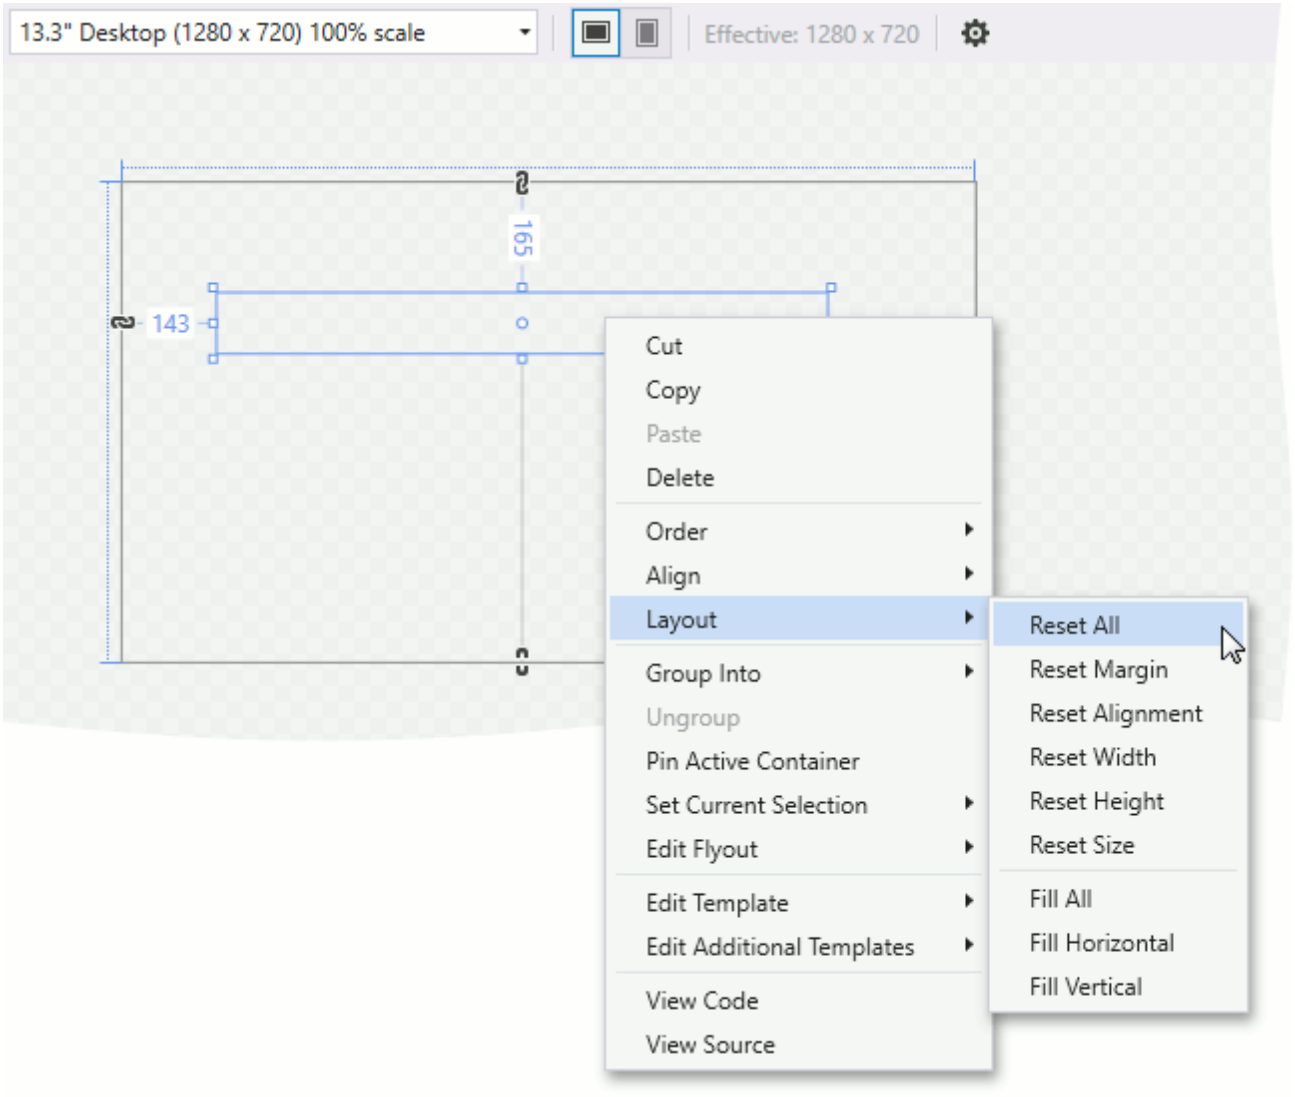


Note

The following SDK extensions will be added to the References list in your project: *DevExpress.Core* and *DevExpress.Visualization*.

Right-click the **LinearGauge** object and choose the **Reset Layout | All** option in the context menu. This will stretch the gauge to fill the entire window.

© 2018 Developer Express Inc.



Your XAML should look like the following. If it doesn't, you can overwrite your code as follows:

Xaml

```
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:Gauges="using:DevExpress.UI.Xaml.Gauges"
    x:Class="CircularGaugeLesson.MainPage">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <Gauges:LinearGauge/>
    </Grid>
</Page>
```

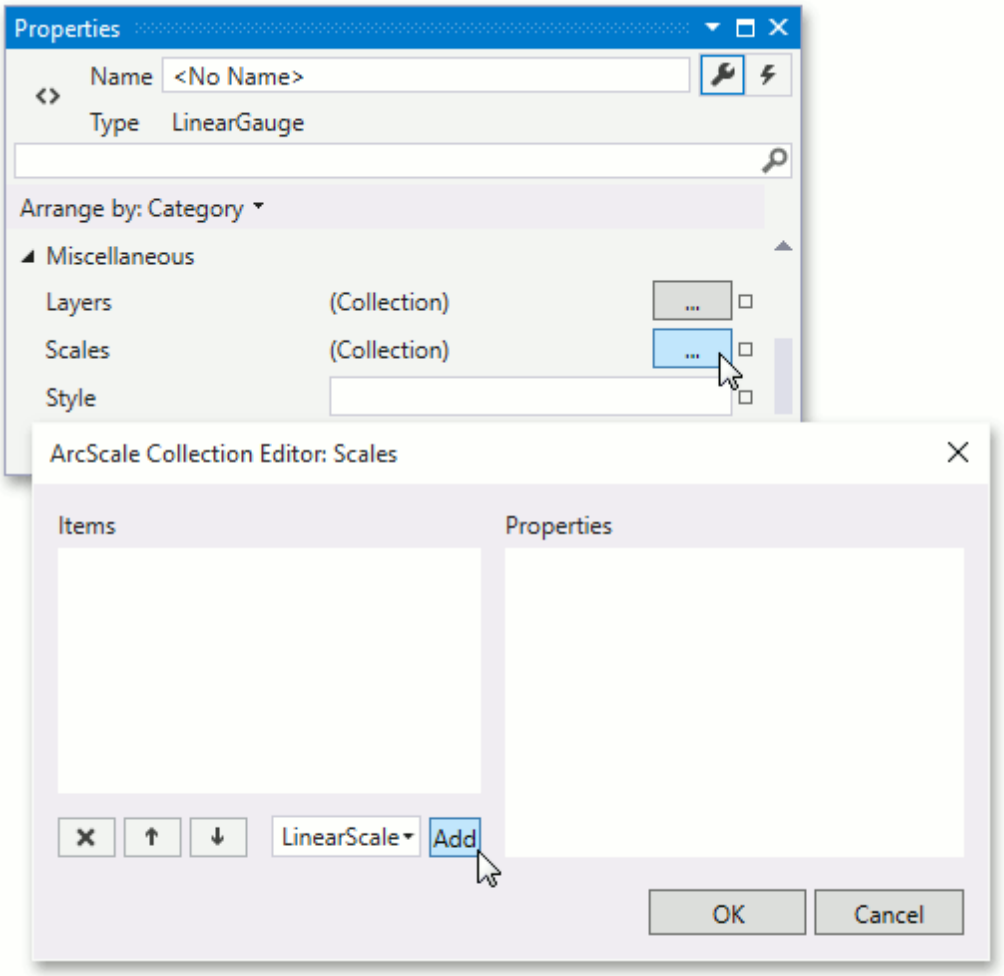
Step 2. Add a Scale

Scales are the main elements of a Gauge control because they contain all other visual elements. The Linear Gauge control can consist of multiple scales, each with an independent set of elements and options, and all scales are stored in the LinearGauge.Scales collection.

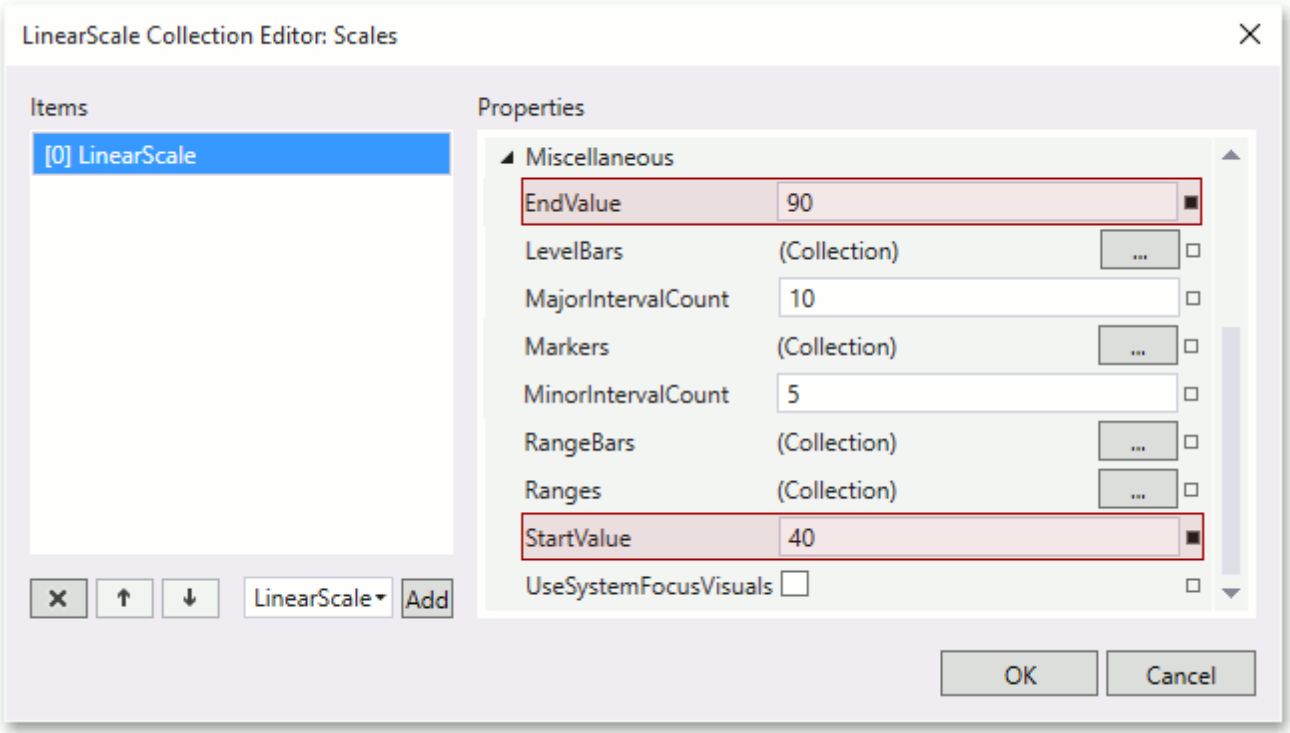
In this lesson, you only need to add one scale for demonstration purposes.

- To add a scale, locate the LinearGauge.Scales property in the **Properties** window and click the ellipsis button to invoke the Scales collection editor. In this editor, add a new LinearScale object using the **Add** button.

© 2018 Developer Express Inc.

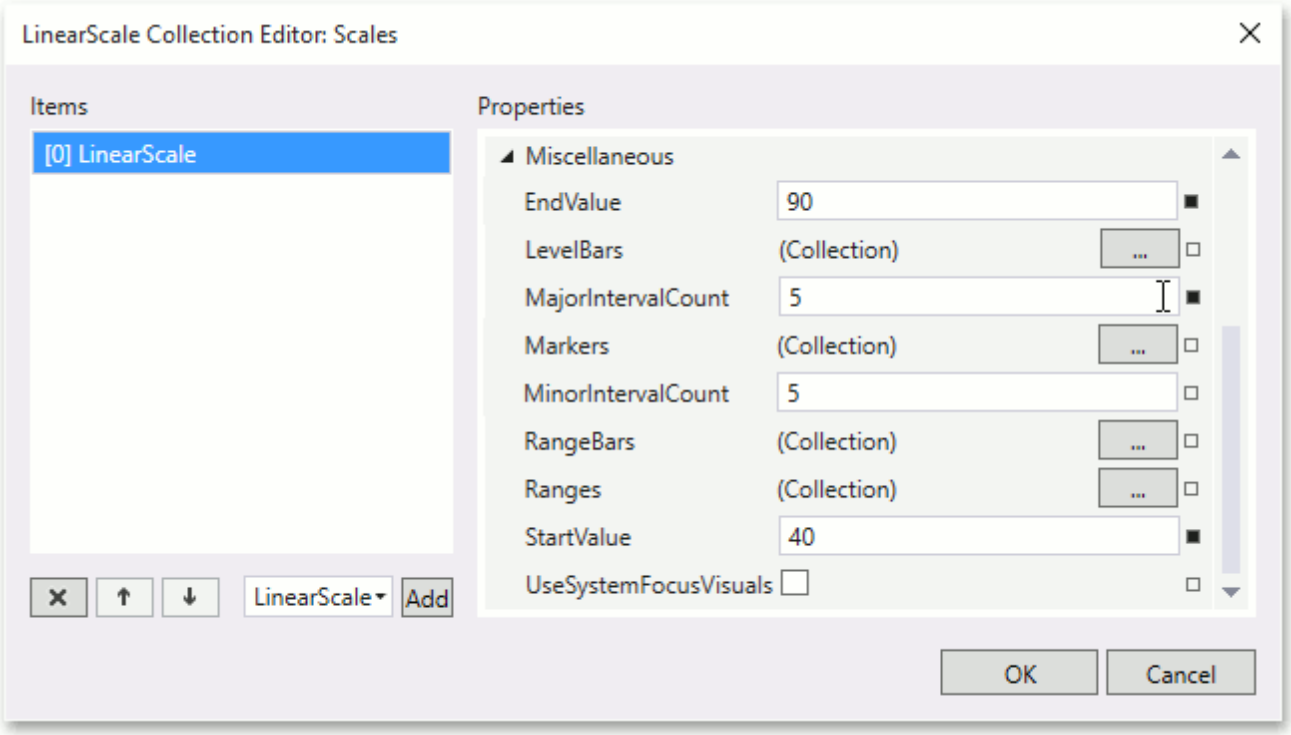


- Set Scale.StartValue to **40** and Scale.EndValue to **90**.

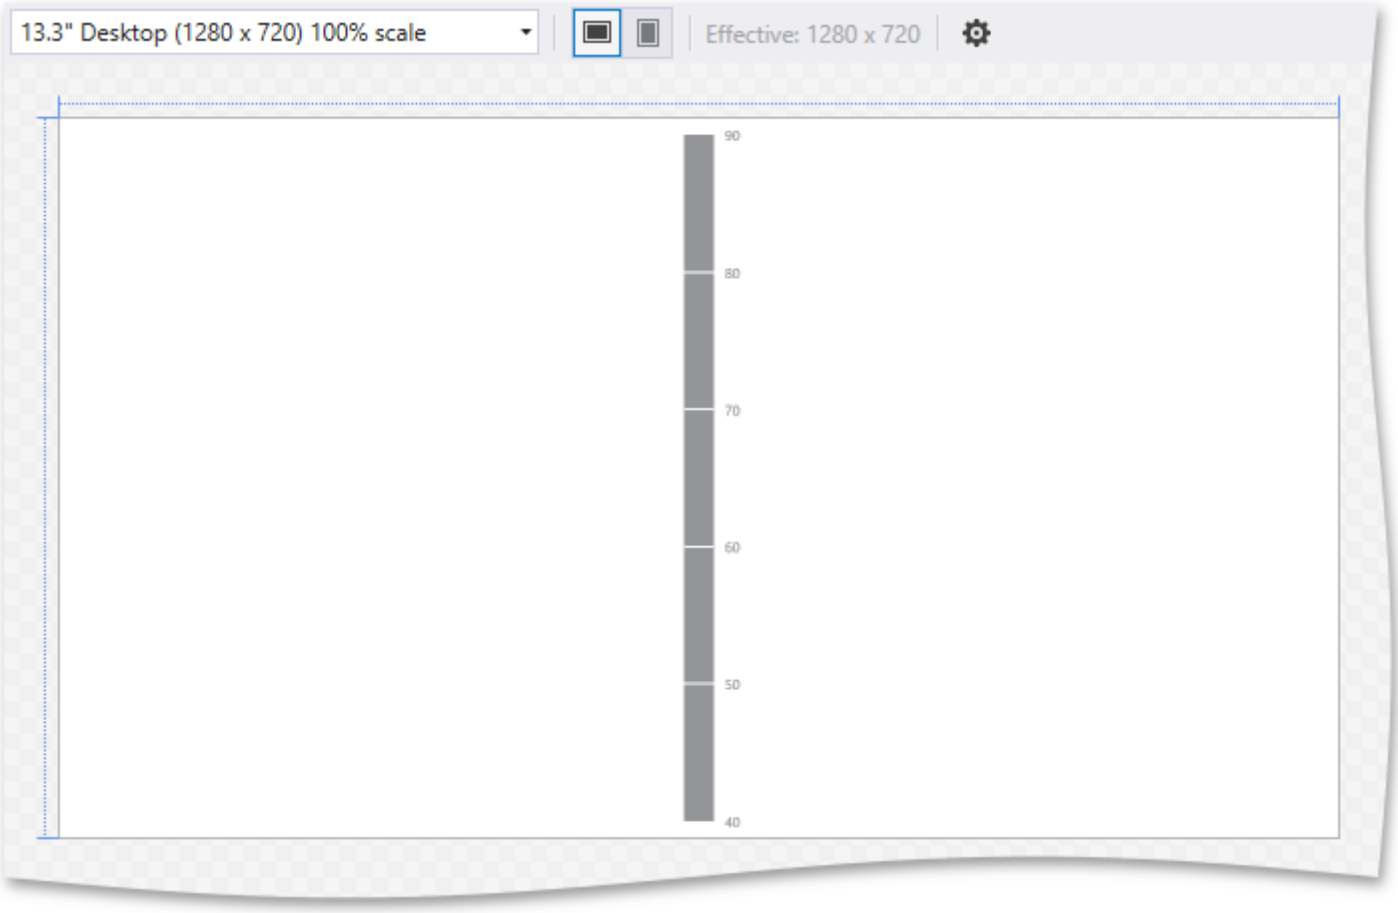


- Set Scale.MajorIntervalCount to **5**.

© 2018 Developer Express Inc.



After performing these actions, the gauge should look like the image below.



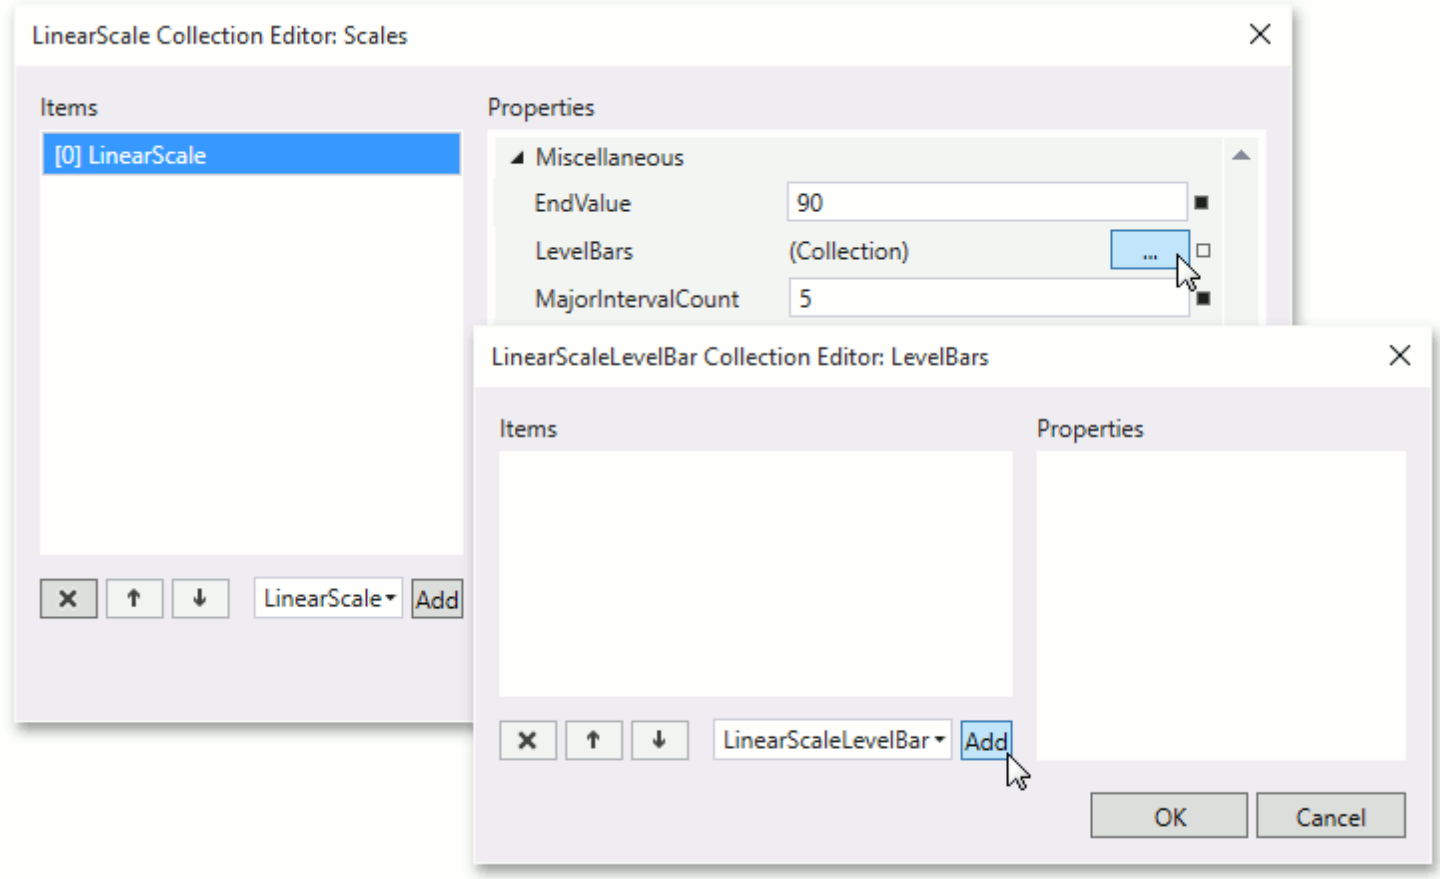
Step 3. Add Value Indicators

© 2018 Developer Express Inc.

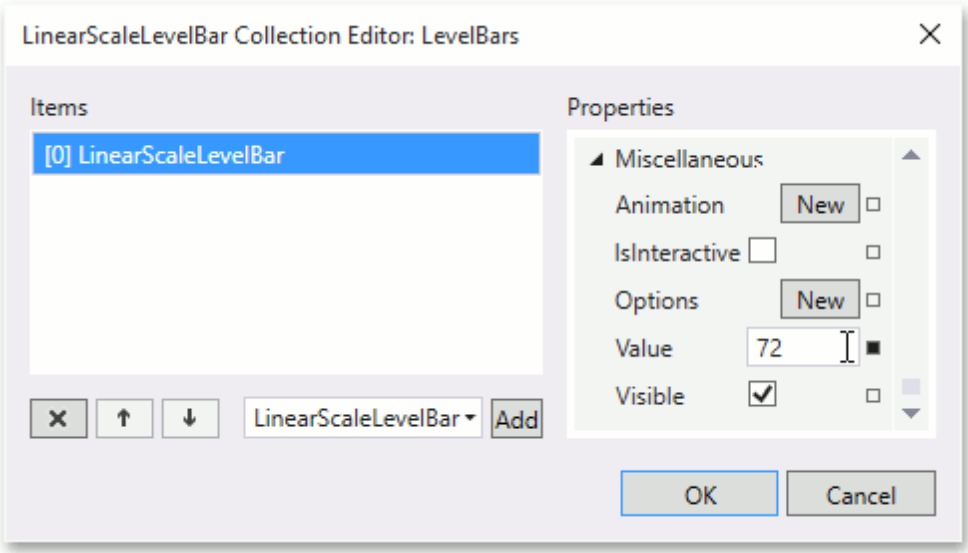
In this step, you can add basic elements that visually represent current values on a Linear scale. In most cases, Linear scales support three indicator types: Level bars, Markers and Range bars.

- Add a Level Bar element that will indicate the current measurement value.

To do this, locate the LinearScale.LevelBars property of the linear scale that was added in the previous step, invoke the Level bar collection editor and click **Add**.



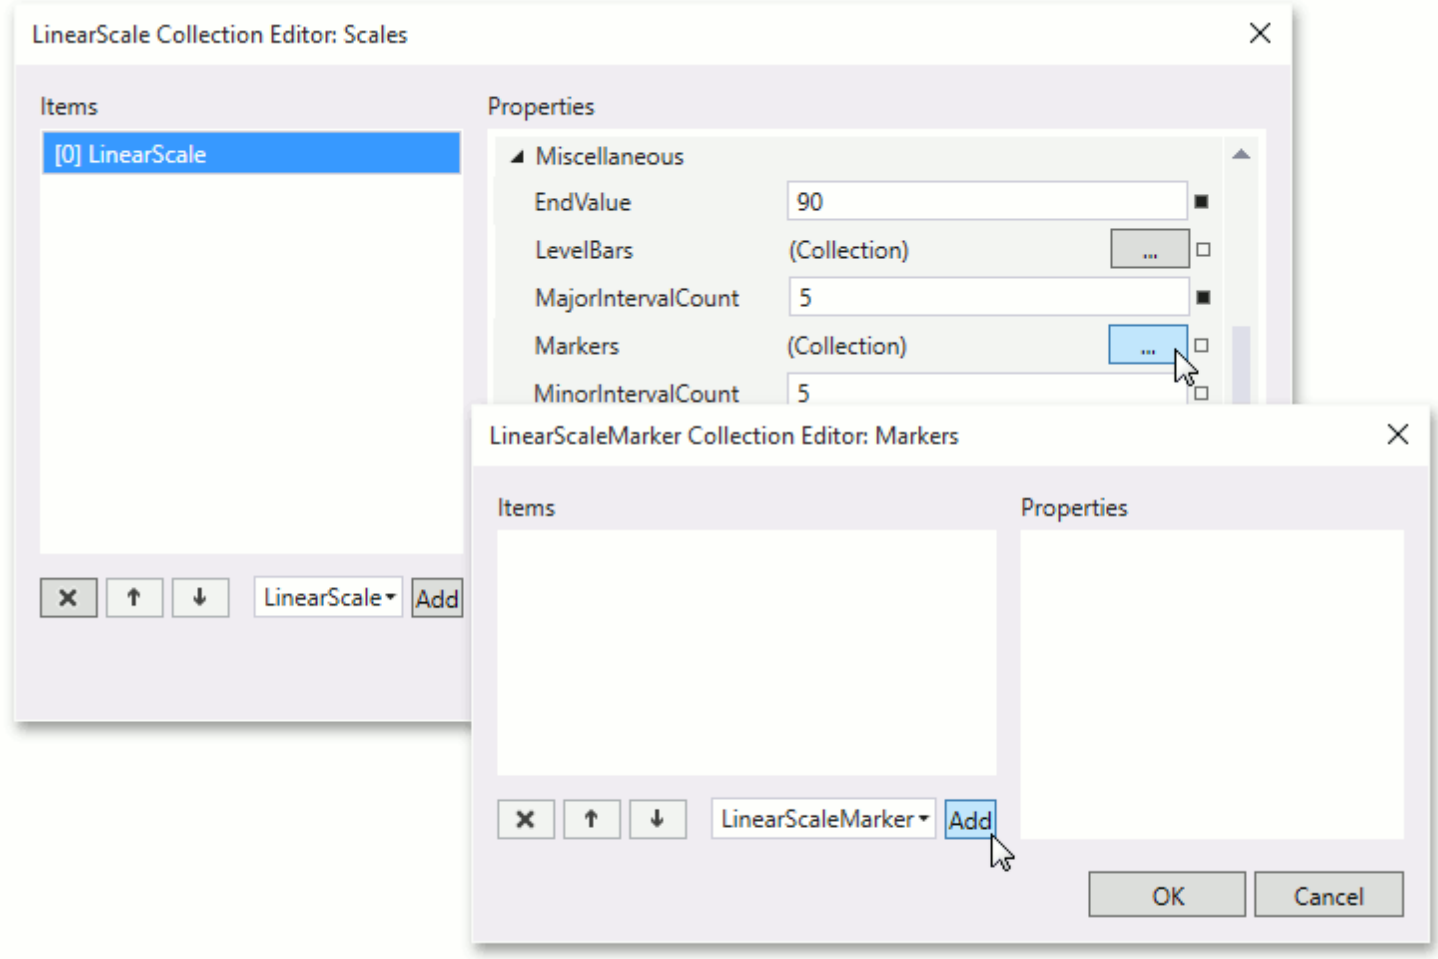
Then, set the ValueIndicatorBase.Value property of the newly created LinearScaleLevelBar object to **72**.



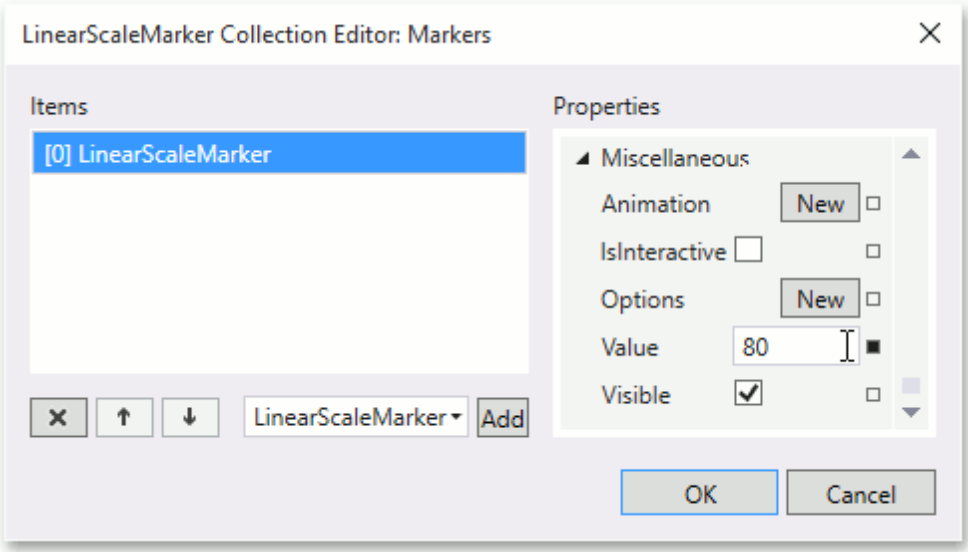
- Add a Marker that will indicate any "fixed" value on a scale.

To do this, locate the LinearScale.Markers property, invoke the Markers collection editor and click **Add**.

© 2018 Developer Express Inc.



Then, set the ValueIndicatorBase.Value property of the newly created LinearScaleMarker object to **80**.

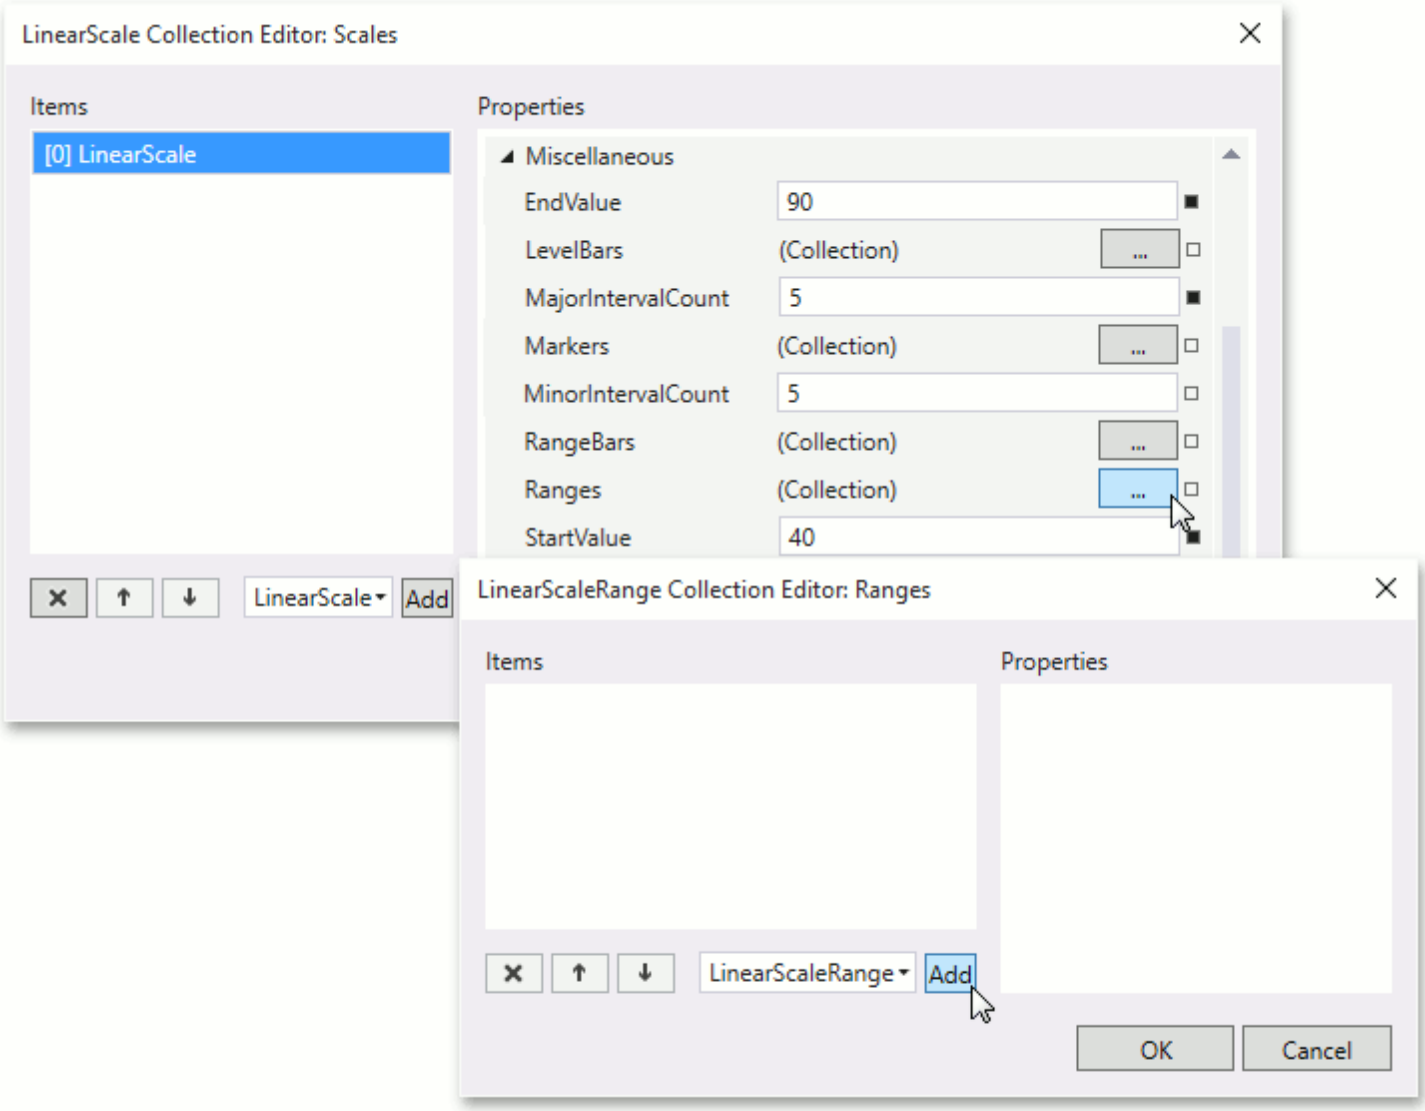


Step 4. Add Ranges

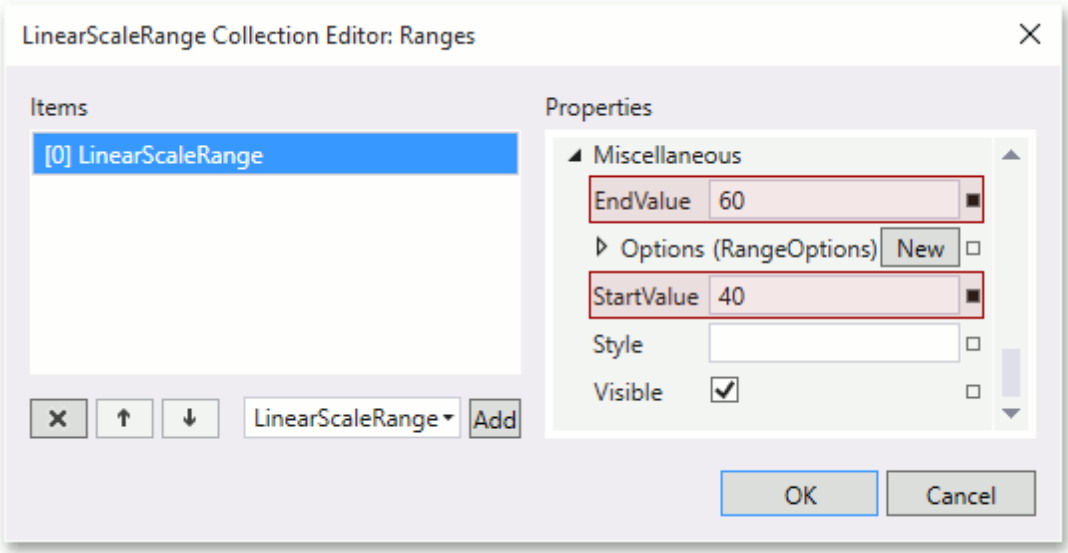
Ranges are intended to visually identify different intervals on a scale.

- To add a range, locate the ArcScale.Ranges property, invoke the Ranges collection editor and click **Add**.

© 2018 Developer Express Inc.

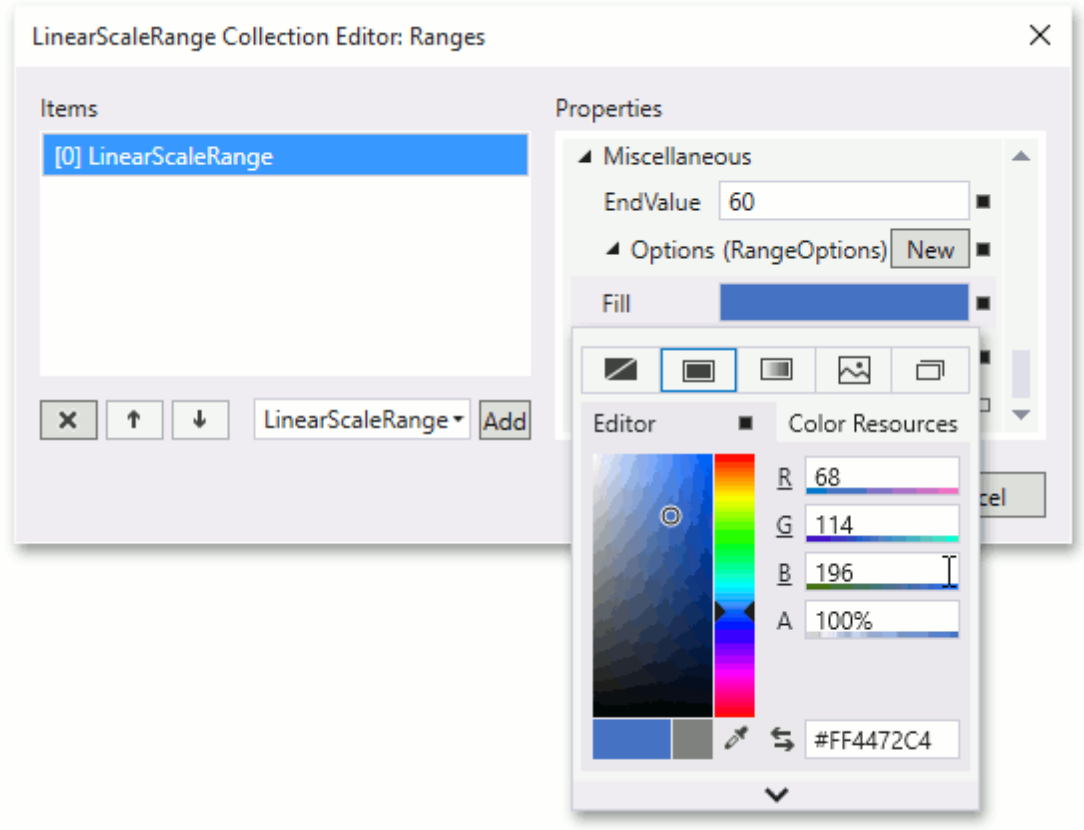


- Set the RangeBase.StartValue property to **40** and the RangeBase.EndValue property to **60**.



- Specify the color of the range. To do this, set the GaugeOptionsBase.Fill property of an RangeOptions object stored in the RangeBase.Options property. Set the **Fill** property to (R=68, G=114, B=196).

© 2018 Developer Express Inc.



- Repeat these actions to add two ranges with the following parameters.

Start value	End value	Fill color
60	80	(R=112, G=173, B=71)
80	90	(R=204, G=33, B=14)

Result

The application is done and the XAML should look like the following.

Concepts

Topics in this section:

- Scales
- Value Indicators

© 2018 Developer Express Inc.

Scales

Windows 10 App Controls > Controls > Gauges > Concepts > Scales

The following document describes what a scale is, what kinds of scales are present in Gauges and also how scales can be used.

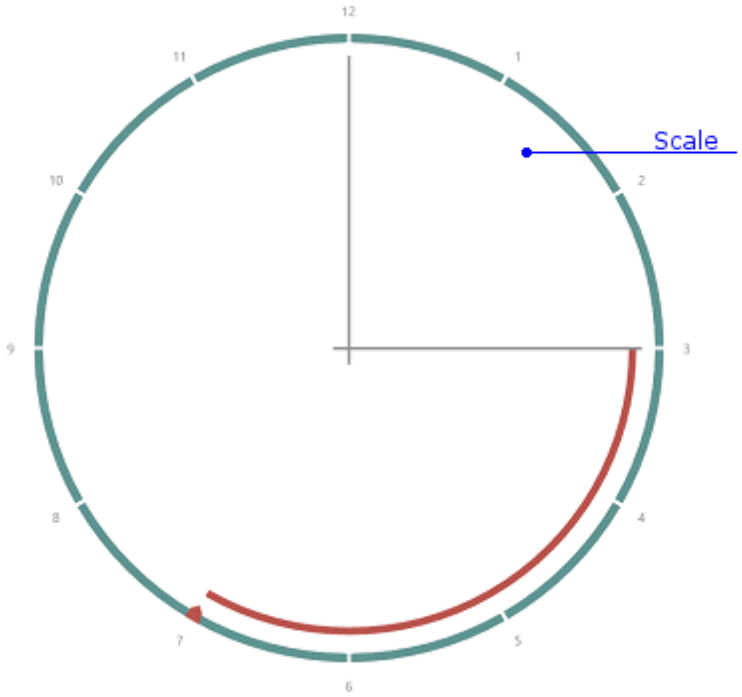
A **Scale** is a key element of a Gauge control. It displays static items as labels, tickmarks, ranges and other elements that visually represent a Gauge control and its appearance; and also contains dynamic gauge elements used to indicate current values of a variable data (so-called Value Indicators).

There are two types of scales, each compatible with its specific Gauge control.

- **Arc Scale**.This scale is intended to be used with the CircularGauge. An instance of an arc scale is represented by the ArcScale object. It can be accessed as an item of the ArcScaleCollection object returned by the CircularGauge.Scales property.

An **Arc Scale** consists of tickmarks, labels, custom labels, ranges, layers and a spindle cap. As value indicators, it can use needles, markers and range bars.

A typical **Arc Scale** is shown in the image below:



- **Linear Scale**. This scale is used with the LinearGauge. It is represented by an instance of the LinearScale class. It can be accessed as an item of the LinearScaleCollection object returned by the LinearGauge.Scales property.

A **Linear Scale** consists of tickmarks, labels, custom labels, ranges, layers. It also uses the following value indicators a level bar, markers and range bars.

© 2018 Developer Express Inc.

Value Indicators

This document gives the definition of a value indicator and also explains what types of value indicators exist and how they should be used in a Gauge control.

A **Value Indicator** is a dynamic gauge element that is used to track the changing of a data value or a data range on a scale. This value can be accessible via the ValueIndicatorBase.Value property of the ValueIndicatorBase class.

Note
The ValueIndicatorBase.Value property of the value indicator can be changed not only programmatically, but also by end-users via mouse-clicks. This capability becomes available after setting the ValueIndicatorBase.IsInteractive property to **true**.

Depending on the type of a Scale, various kinds of value indicators can be used with it.

Arc Scale's Indicators

The following value indicators are appropriate for the Arc Scale.

Element	Description	Class	Collection	Accessibilty
Needle	A needle-like element that is used to indicate a current value in a Circular Gauge.	ArcScaleNeedle	ArcScaleNeedleCollection	ArcScale.Needles
Marker	A Marker is a small pointer that indicates a fixed value.	ArcScaleMarker	ArcScaleMarkerCollection	ArcScale.Markers
Range Bar	A Range Bar is a filled sector that represents a specific interval (e.g. working hours).	ArcScaleRangeBar	ArcScaleRangeBarCollection	ArcScale.RangeBars

Linear Scale's Indicators

In the Linear Scale three types of value indicators are available.

Element	Description	Class	Collection	Accessibilty
Level Bar	A Level Bar performs the same function as a conventional thermometer (e.g. the current temperature).	LinearScaleLevelBar	LinearScaleLevelBarCollection	LinearScale.LevelBars
Marker	A Marker is a scale pointer that indicates a certain value along a scale (e.g. an average temperature in a thermometer).	LinearScaleMarker	LinearScaleMarkerCollection	LinearScale.Markers
Range Bar	A Range Bar is a filled rectangle that represents some data range along a scale.	LinearScaleRangeBar	LinearScaleRangeBarCollection	LinearScale.RangeBars

Circular Gauge

The following elements are displayed in a Circular gauge.

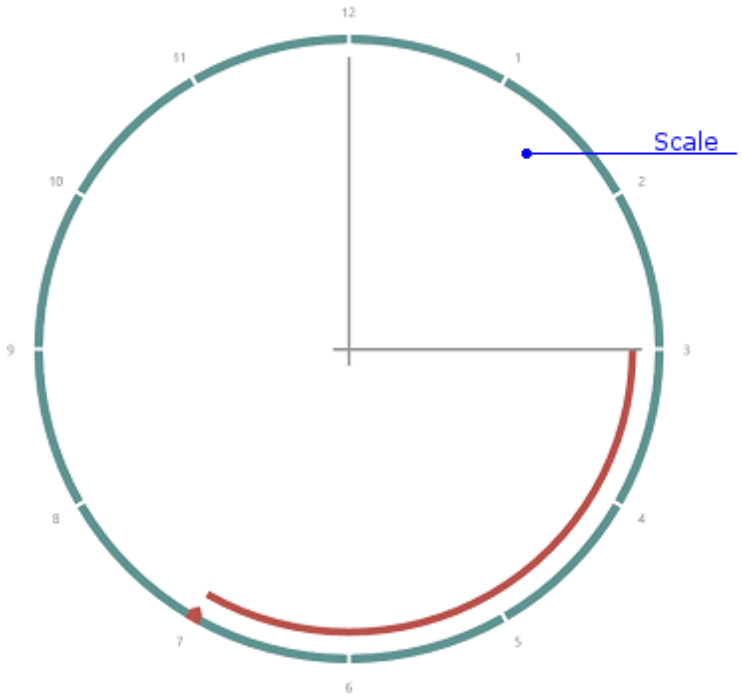
- Arc Scale
- Needle
- Marker
- Range Bar
- Range
- Tickmarks
- Line
- Labels
- Custom Labels
- Layers
- Spindle Cap
- Custom Elements

© 2018 Developer Express Inc.

Arc Scale

An **Arc Scale** is the main visual element of a Circular Gauge, because it contains all other elements (e.g., Needle, Marker and Custom Labels.).

A Circular Gauge can contain either a single Arc Scale or multiple Arc Scales.



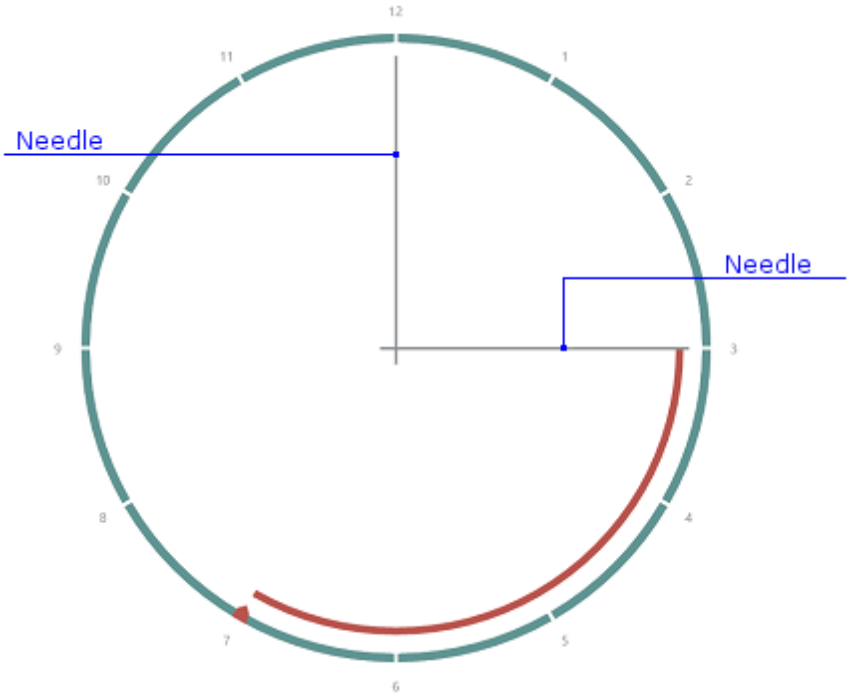
For more information on an **Arc Scale**, refer to the Scales document.

© 2018 Developer Express Inc.

Needle

Windows 10 App Controls > Controls > Gauges > Visual Elements > Circular Gauge > Needle

A **Needle** is used to indicate the current value in a Circular Gauge. Some gauges can have multiple Needles (e.g., a clock).

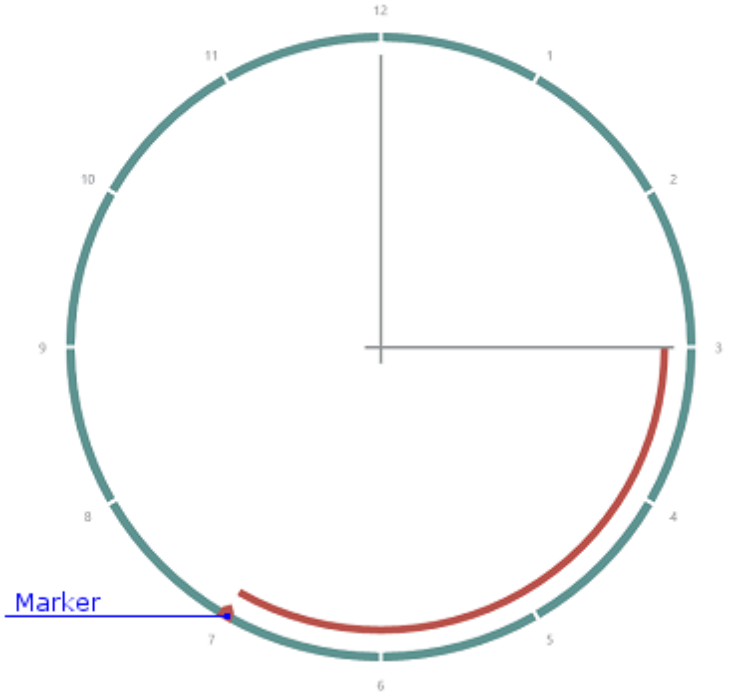


For more information on a **Needle**, refer to the Value Indicators document.

© 2018 Developer Express Inc.

Marker

A **Marker** is a small pointer that indicates a fixed value.

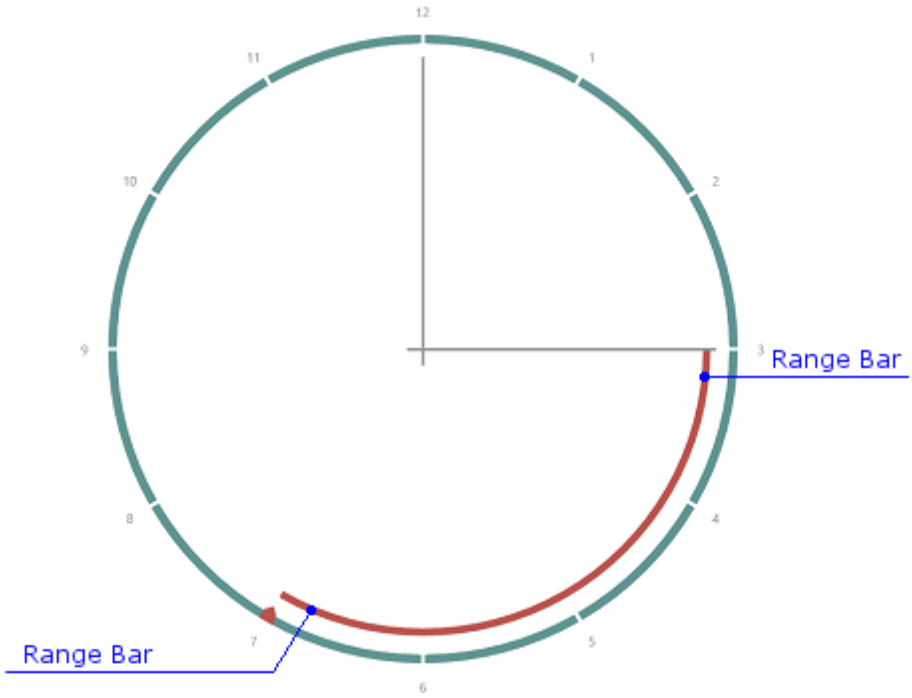


For more information on a **Marker**, refer to the Value Indicators document.

© 2018 Developer Express Inc.

Range Bar

A **Range Bar** is a filled sector that represents a specific interval (e.g., working hours).

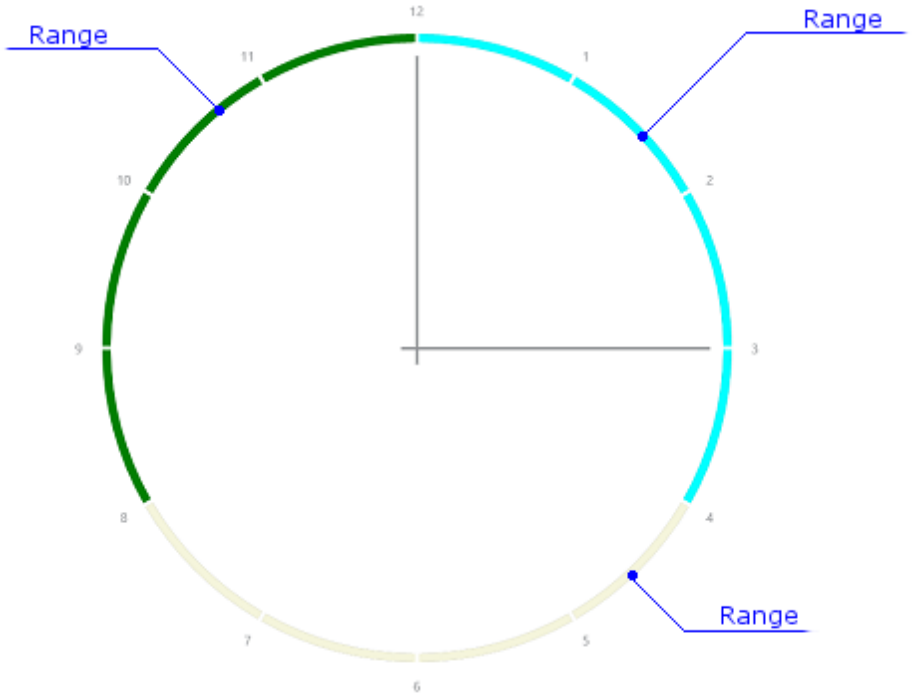


For more information on a **Range Bar**, refer to the Value Indicators document.

© 2018 Developer Express Inc.

Range

A **Range** marks a certain interval on a Circular Gauge. A Circular Gauge can contain multiple ranges, which are displayed as bars along a Scale.

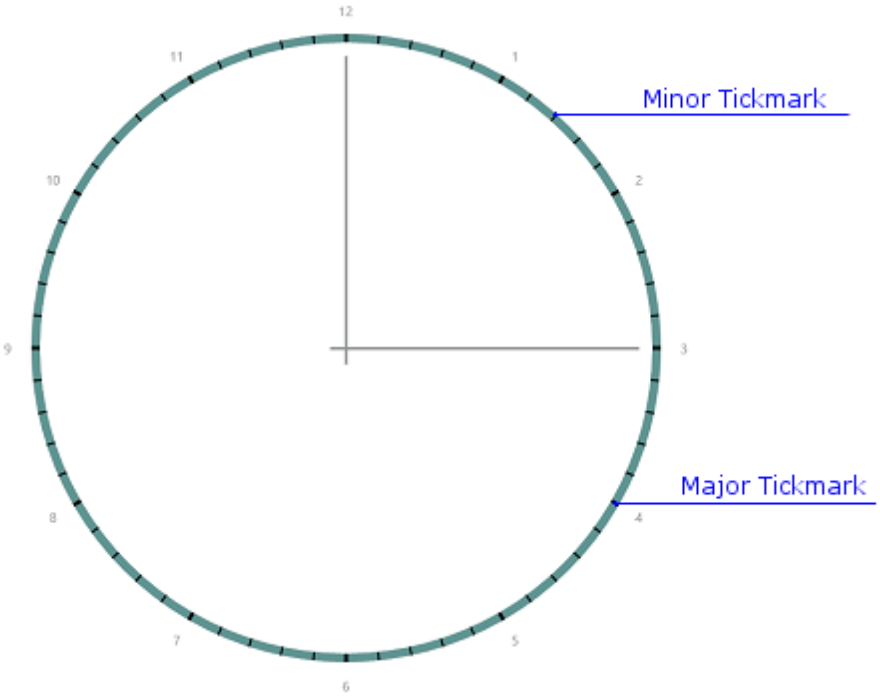


A Range is represented by an instance of the ArcScaleRange class, which should be added to the ArcScaleRangeCollection returned by the ArcScale.Ranges property.

© 2018 Developer Express Inc.

Tickmarks

Tickmarks are used to represent a point on an axis scale. In a Circular Gauge, two types of tickmarks are available depending on the steps that they indicate on an axis scale: Major or Minor.

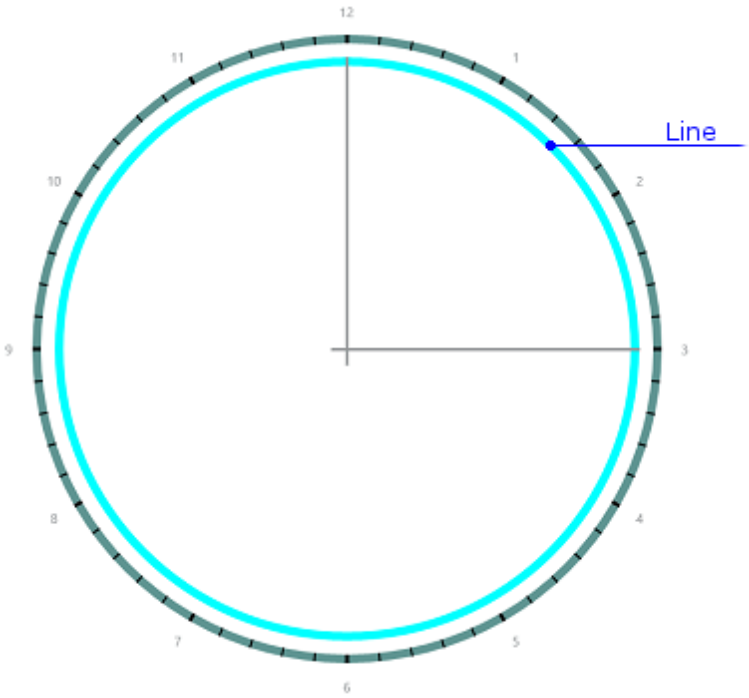


Tickmarks are defined by instances of the MinorTickmarkOptions and MajorTickmarkOptions classes, returned by the Scale.MinorTickmarkOptions and Scale.MajorTickmarkOptions properties.

© 2018 Developer Express Inc.

Line

A **Line** indicates the entire interval along the tickmarks on a scale and is used for decoration purposes. A Line is usually placed under the tickmarks, but you can change its position by using the ScaleLineOptions.Offset property.



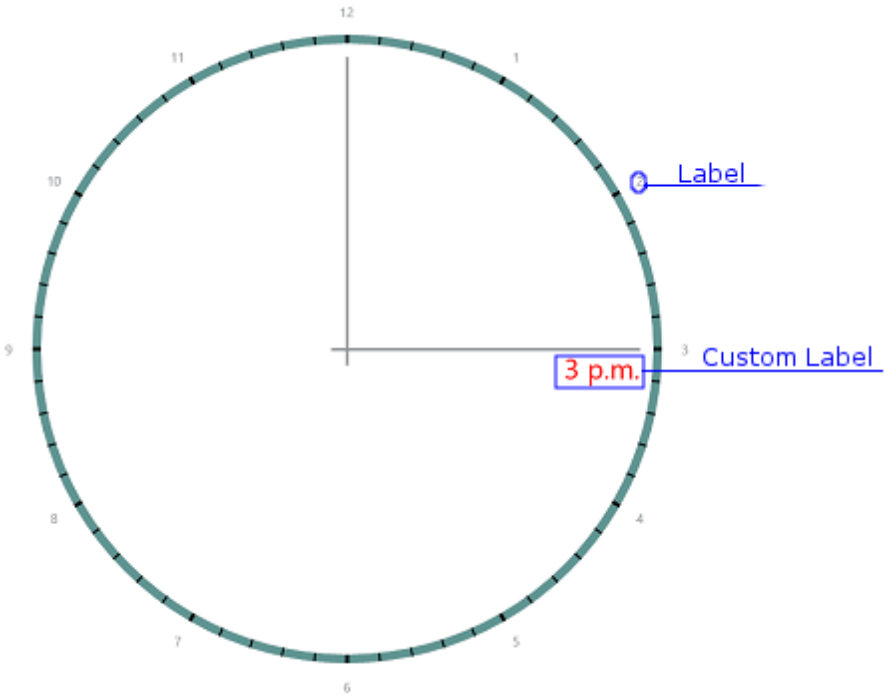
A Line is defined by an instance of the ScaleLineOptions class returned by the Scale.LineOptions property.

© 2018 Developer Express Inc.

Labels

Two kinds of **Labels** are available for an Arc Scale:

- Standard Labels, whose position is determined by the ArcScale.LabelOptions property.
- Custom Labels that can be placed at any location along a scale.



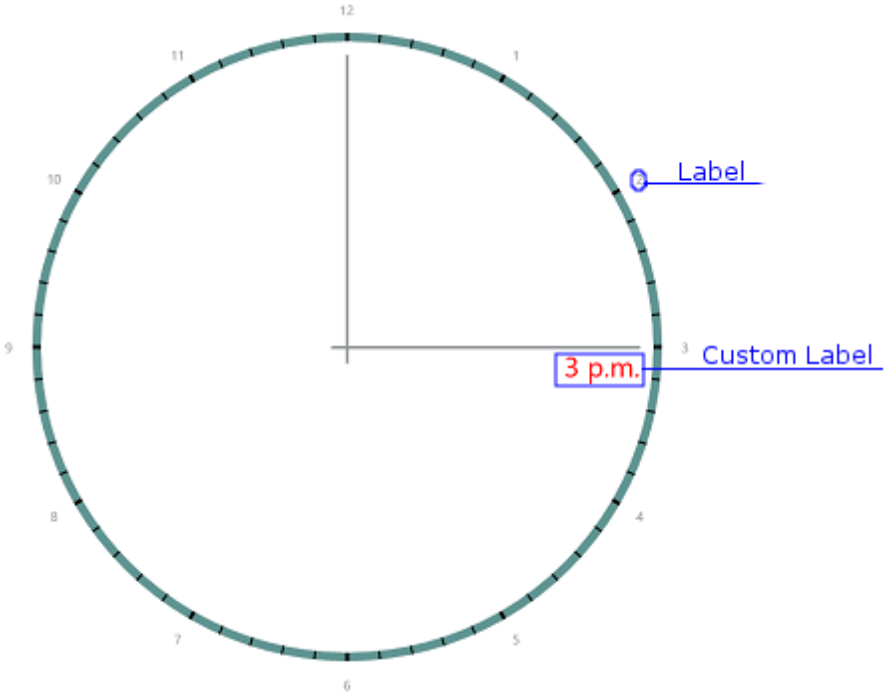
Standard Labels are defined by the ArcScaleLabelOptions object that can be accessed via the ArcScale.LabelOptions property.

© 2018 Developer Express Inc.

Custom Labels

Windows 10 App Controls > Controls > Gauges > Visual Elements > Circular Gauge > Custom Labels

Custom Labels allow you to display custom text and place it in any position on a Circular gauge.



Custom Labels are represented by an instance of the ScaleCustomLabel class, which should be added to the ScaleCustomLabelCollection returned by the Scale.CustomLabels property.

© 2018 Developer Express Inc.

Layers

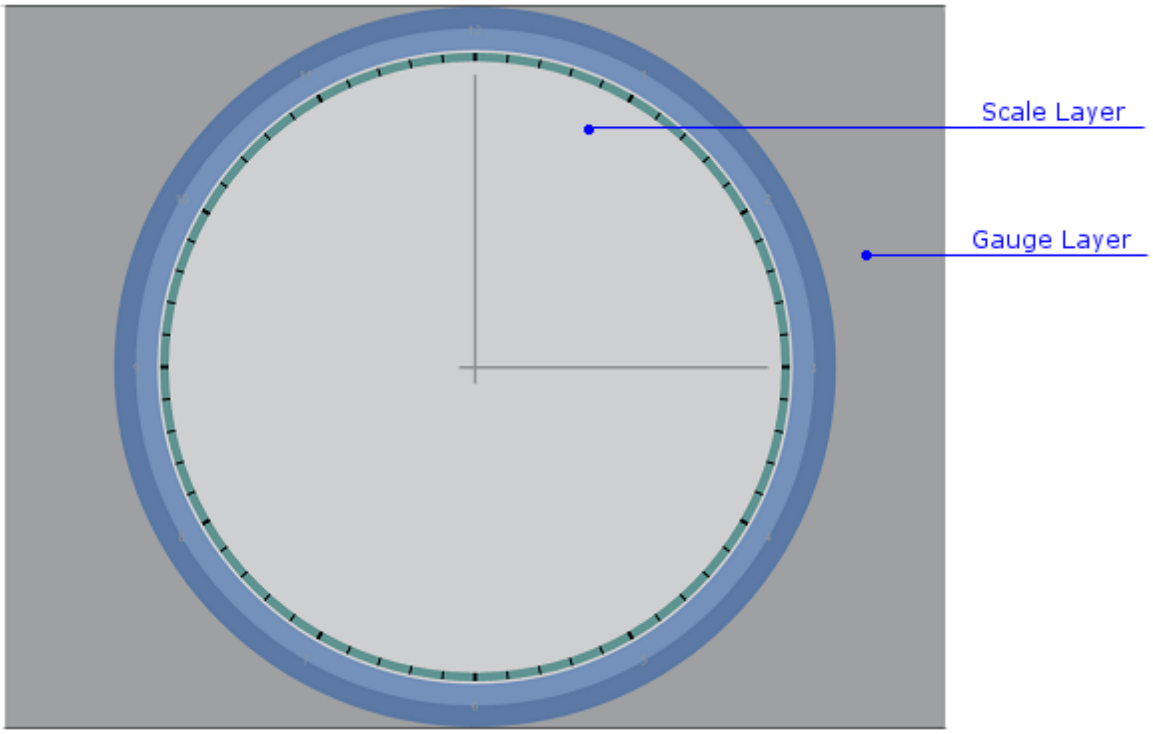
Windows 10 App Controls > Controls > Gauges > Visual Elements > Circular Gauge > Layers

A **Layer** is an element that contains different objects (e.g., images) to define the visual presentation of a gauge and its elements.

Layers can be added at two levels:

- At the Gauge control level. In this case, layers are represented by CircularGaugeLayer objects contained in the CircularGaugeLayerCollection object, which can be accessed via the CircularGauge.Layers property.
- At the Arc Scale level. In this case, layers are represented by ArcScaleLayer objects contained in the ArcScaleLayerCollection object, which can be accessed via the ArcScale.Layers property.

For example, the following picture illustrates two layers - one is added to the CircularGauge and therefore occupies the entire Gauge control area, and the other is added to the ArcScale object.

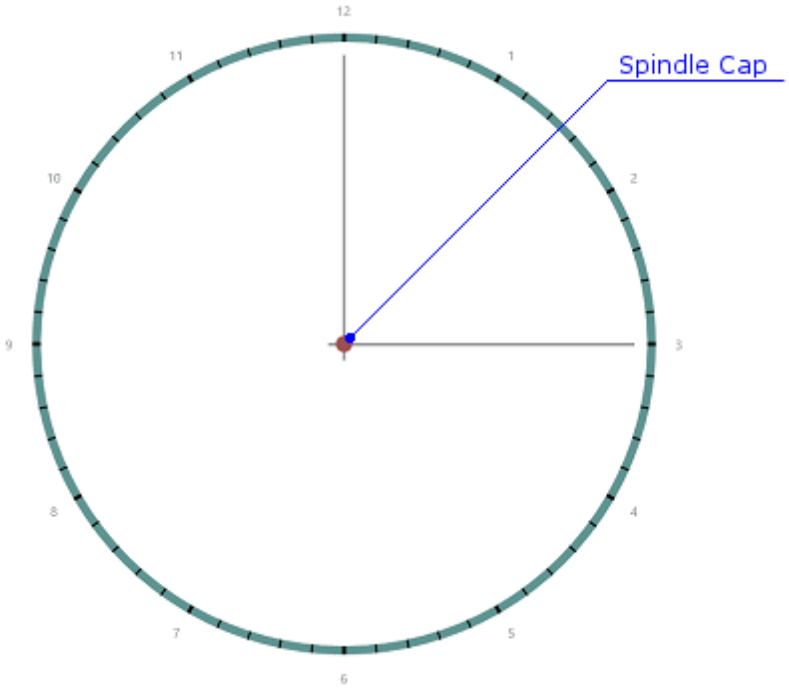


Every new layer is painted behind all other gauge elements because its GaugeOptionsBase.ZIndex property is set to **-100** by default. To bring this layer to the front of other gauge elements (or paint it above other layers, if there are any), set the **ZIndex** property to a greater value.

© 2018 Developer Express Inc.

Spindle Cap

A **Spindle Cap** is a fixed element that is located at the center of a Circular Gauge.



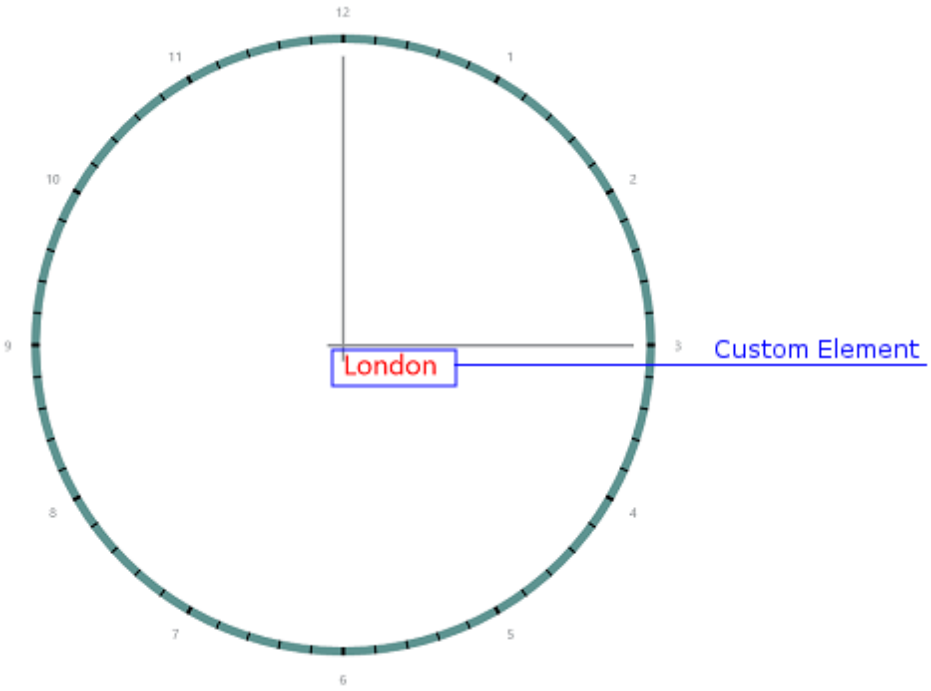
A Spindle Cap is defined by an instance of the SpindleCapOptions class, returned by the ArcScale.SpindleCapOptions property.

© 2018 Developer Express Inc.

Custom Elements

A **Custom Element** is used to embed any custom content into the Circular Gauge control.

Note that you can use any object as a custom element. For example, the image below shows a Circular Gauge with two custom elements: an image and a text block.



A custom element is defined by an instance of the ScaleCustomElement class, which should be added to the ScaleCustomElementCollection returned by the Scale.CustomElements property.

© 2018 Developer Express Inc.

Linear Gauge

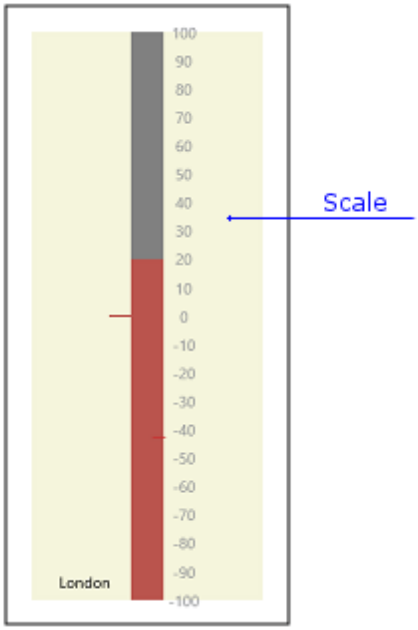
The following elements are displayed in a Linear gauge.

- Linear Scale
- Level Bar
- Marker
- Range Bar
- Range Bar
- Tickmarks
- Line
- Labels
- Custom Labels
- Layers
- Custom Elements

© 2018 Developer Express Inc.

Linear Scale

A **Scale** is the main element of a Linear gauge. It allows you to read measured data (e.g. a thermometer scale). A Linear Gauge can contain one or more Scales.

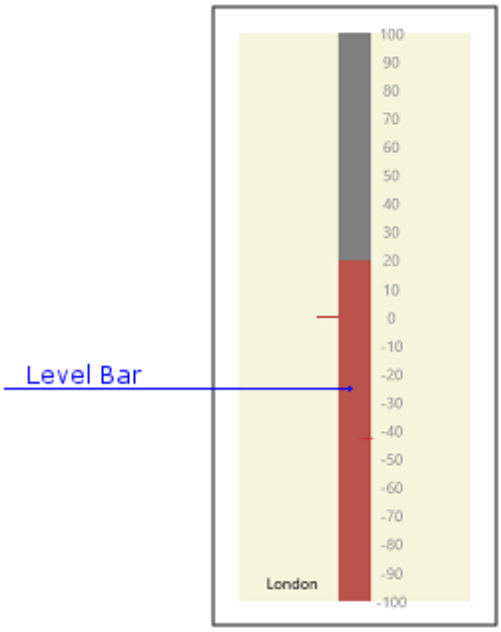


For more information on a **Linear Scale**, refer to the Scales document.

© 2018 Developer Express Inc.

Level Bar

A **Level Bar** performs the same function as a conventional thermometer (e.g. the current temperature).

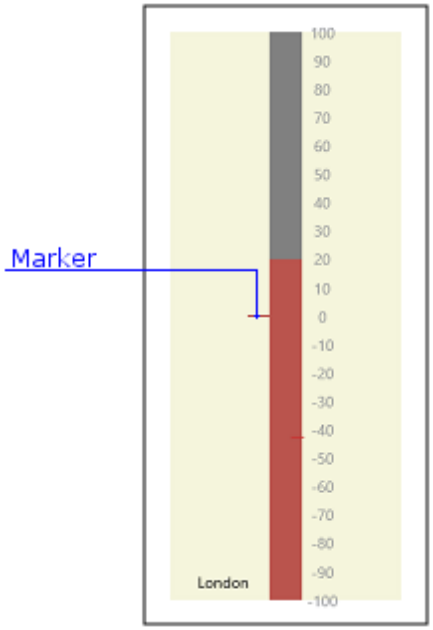


For more information on a **Level Bar**, refer to the Value Indicators document.

© 2018 Developer Express Inc.

Marker

A **Marker** is a scale pointer that indicates a certain value along a Scale (e.g. the average temperature in a thermometer).

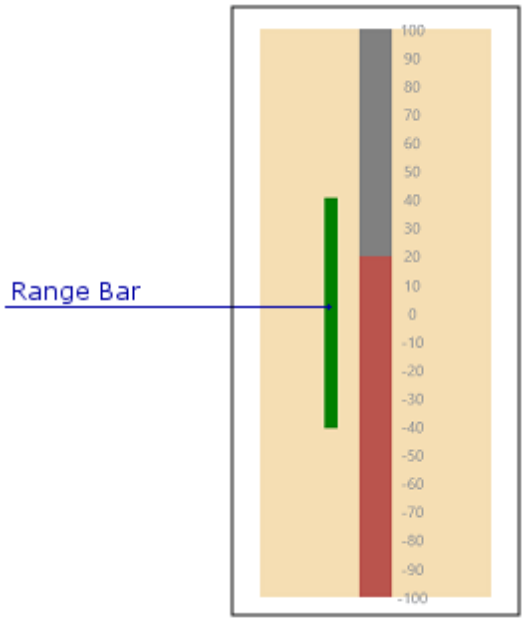


For more information on a **Marker**, refer to the Value Indicators document.

© 2018 Developer Express Inc.

Range Bar

A **Range Bar** is a filled rectangle that represents a data range along a Scale.



For more information on a **Range Bar**, refer to the Value Indicators document.

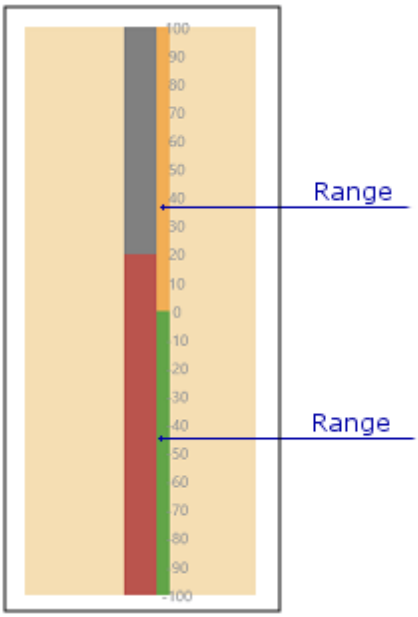
© 2018 Developer Express Inc.

Range

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Range

A **Range** represents an interval on a Scale. A Scale can contain multiple Ranges.

A Range is represented by an instance of the LinearScaleRange class, which should be added to the LinearScaleRangeCollection returned by the LinearScale.Ranges property.



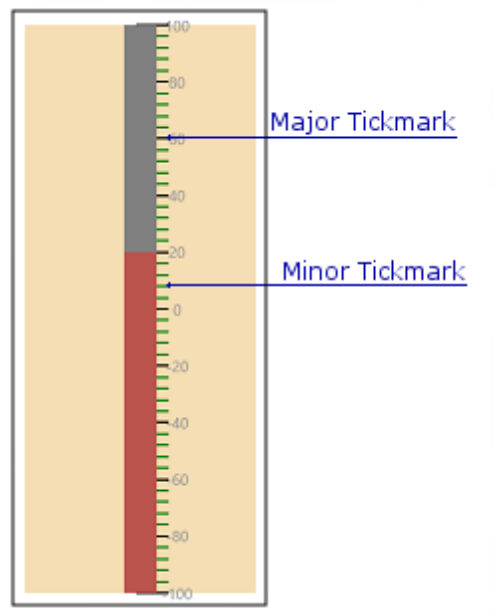
© 2018 Developer Express Inc.

Tickmarks

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Tickmarks

Tickmarks are points on a Scale. There are two types of tickmarks that correspond to the steps of an axis Scale: Major and Minor.

Tickmarks are defined by an instance of the TickmarkOptions class, returned by the Scale.MinorTickmarkOptions and Scale.MajorTickmarkOptions property.



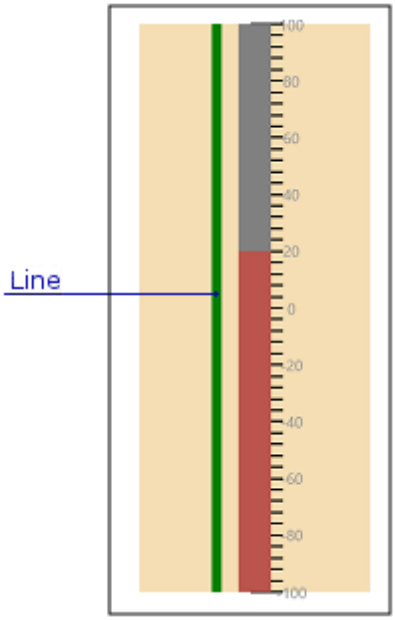
© 2018 Developer Express Inc.

Line

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Line

A **Line** indicates a scale and can be used for decoration purposes. By default, it is placed under tickmarks, but you can change its position by using the ScaleLineOptions.Offset property.

A Line is defined by an instance of the ScaleLineOptions class returned by the Scale.LineOptions property.



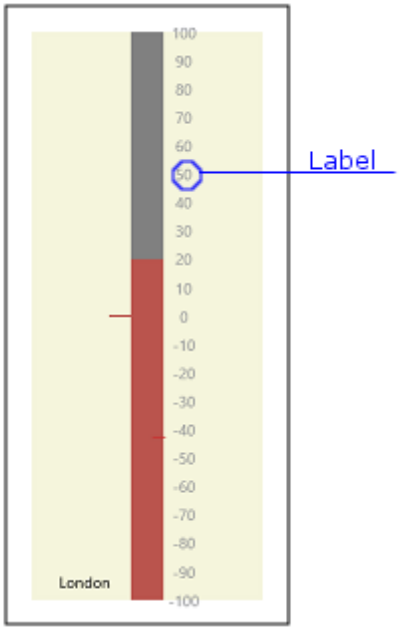
© 2018 Developer Express Inc.

Labels

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Labels

Labels reflect scale values. Two types of Labels are available.

- Scale Labels associated with tickmarks on a Scale.
- Custom Labels that can be located anywhere on a Scale.



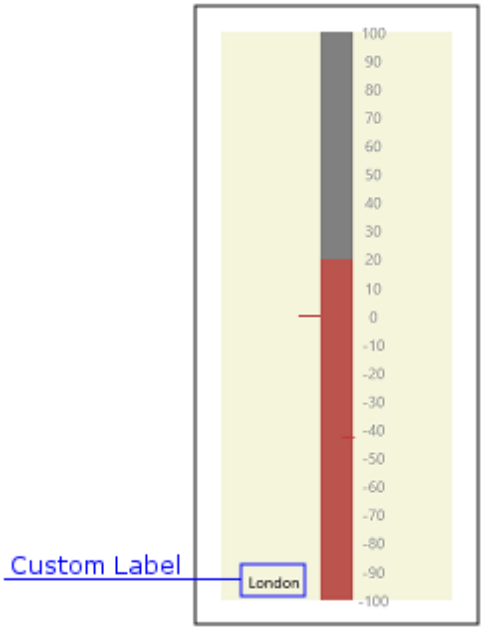
Standard Labels are defined by the LinearScaleLabelOptions object that can be accessed via the LinearScale.LabelOptions property.

© 2018 Developer Express Inc.

Custom Labels

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Custom Labels

Custom Labels allow you to display custom text and place it in any position in the Linear gauge.



Custom Labels are represented by an instance of the ScaleCustomLabel class, which should be added to the ScaleCustomLabelCollection returned by the Scale.CustomLabels property.

© 2018 Developer Express Inc.

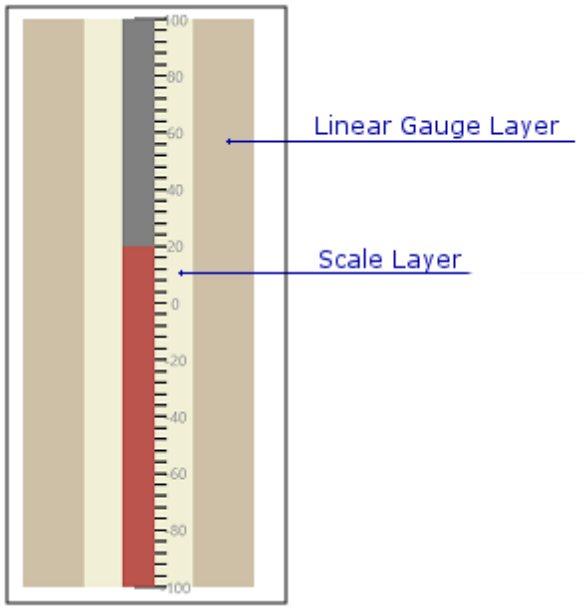
Layers

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Layers

Layer is an element that contains different objects (e.g. images) to define the visual presentation of a gauge and its elements.

Layers can be added at two levels:

- At the Gauge control's level. In this case layers are represented by LinearGaugeLayer objects contained in the LinearGaugeLayerCollection object, which can be accessed via the LinearGauge.Layers property.
- At the Linear Scale's level. In this case, layers are represented by LinearScaleLayer objects contained in the LinearScaleLayerCollection object, which can be accessed via the LinearScale.Layers property.



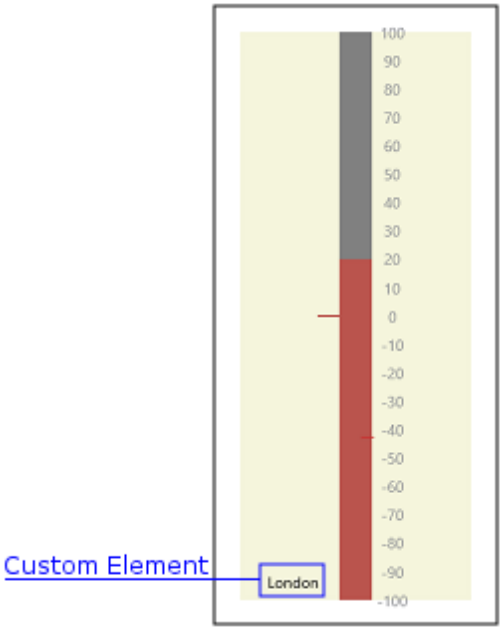
Every new layer is painted behind all other gauge elements, because its GaugeOptionsBase.ZIndex property is set to **-100** by default. If you want to bring this layer in front of other gauge elements (or paint it above other layers, if there are any), you need to set the **ZIndex** property to a greater value.

© 2018 Developer Express Inc.

Custom Elements

Windows 10 App Controls > Controls > Gauges > Visual Elements > Linear Gauge > Custom Elements

A **Custom Element** allows you to add any control to a gauge linear scale.



A custom element is defined by an instance of the ScaleCustomElement class, which should be added to the ScaleCustomElementCollection returned by the Scale.CustomElements property.

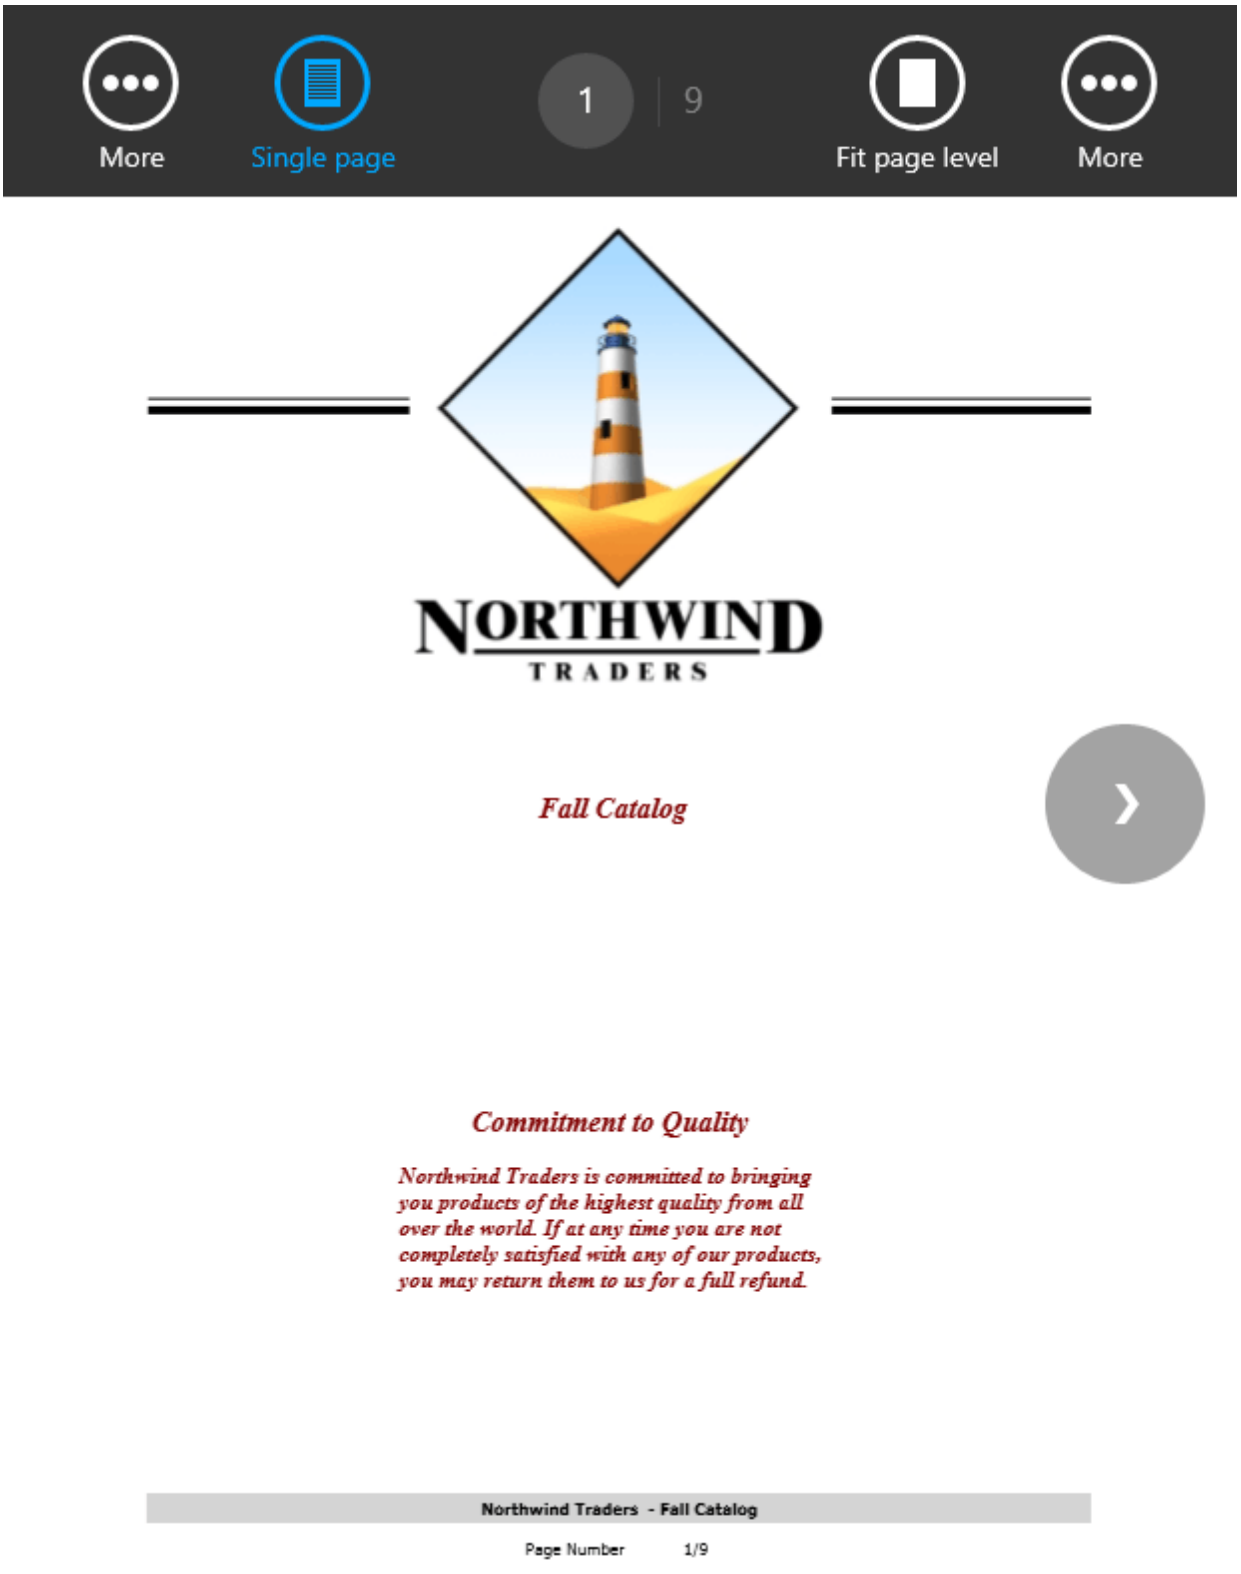
PDF Viewer

Windows 10 App Controls > Controls > PDF Viewer

This suite includes the **PDF Viewer Control** (PdfViewerControl), which is used to display PDF documents in Universal Windows applications.

This document describes the main features of the PDF Viewer as well as its current limitations.

© 2018 Developer Express Inc.



Features

The PDF Viewer Control provides the following features.

- Text search, selection and copying
- Printing
- Bookmarks

© 2018 Developer Express Inc.

- Attachments
- Support for touch devices
- Zooming, scrolling and continuous page layout

The PDF Viewer supports the following document content.

- Text
- Images
- Vector graphics (including shapes)
- Annotations
- Embedded fonts (including **TrueType**, **PostScript Type 1** and **OpenType**)
- CID fonts (**TrueType** and **OpenType**)
- File attachments

Limitations

The current PDF Viewer does not implement the following functionalities, as each requires extensive development and testing to ensure compliance with the official PDF specification - for the same reason, it is not possible to estimate when they will be introduced.

- **JPEG2000** and **JBIG2** images
- Interactive forms
- **CalRGB**, **CalGray**, **Pattern**, **Separation**, **DeviceN**, **ICC** and **Lab** color spaces
- **Type 3** fonts

Getting Started

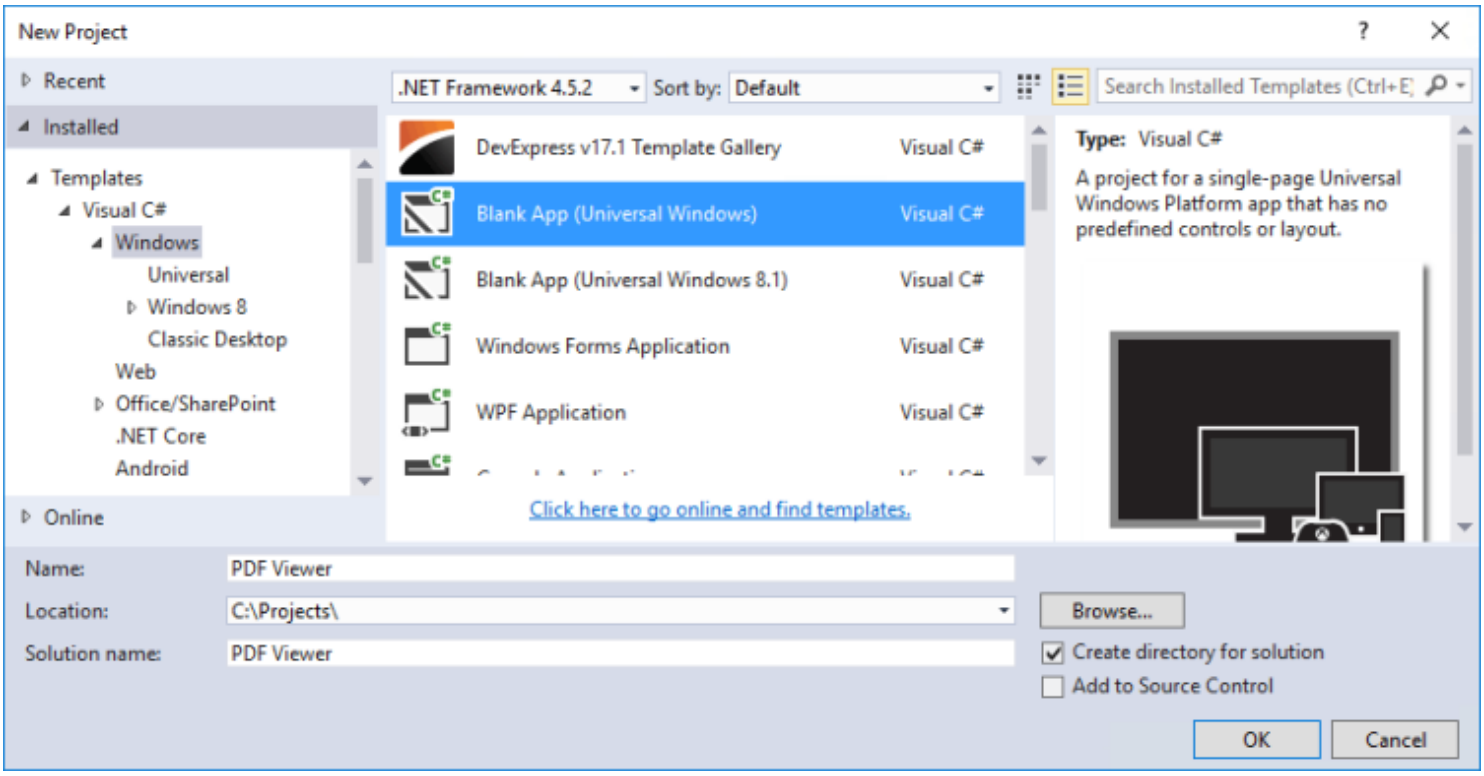
© 2018 Developer Express Inc.

Getting Started

Windows 10 App Controls > Controls > PDF Viewer > Getting Started

This tutorial describes how to create a Windows 10 PDF Viewer that opens, previews, navigates and prints PDF documents.

- Run Microsoft Visual Studio 2015 or 2017.
- Create a new **Blank App (Universal Windows)** project. If prompted, select the target and minimum platform versions that your application will support.



- Add a PdfViewerControl component to the project.

To do this, drag the **PdfViewerControl** from the **DX.18.1: Common Controls** Toolbox tab and drop it onto the main page. The following code will be generated.

Xaml

```
<Page xmlns:my="using:DevExpress.UI.Xaml.Controls"
    x:Class="PDF_Viewer.MainPage"
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:PDF_Viewer"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    mc:Ignorable="d">
    <Grid Background="{ThemeResource ApplicationPageBackgroundThemeBrush}">
        <my:PdfViewerControl />
    </Grid>
</Page>
```

You can add the **PdfViewerControl** by overwriting your **MainPage.xaml** file with this code without dragging the **PdfViewerControl** to the page. However, in this case, you need to manually add references to the following libraries.

- DevExpress.Controls
- DevExpress.Core

To add them, right-click **References** in the Solution Explorer and select **Add Reference** in the invoked context menu.

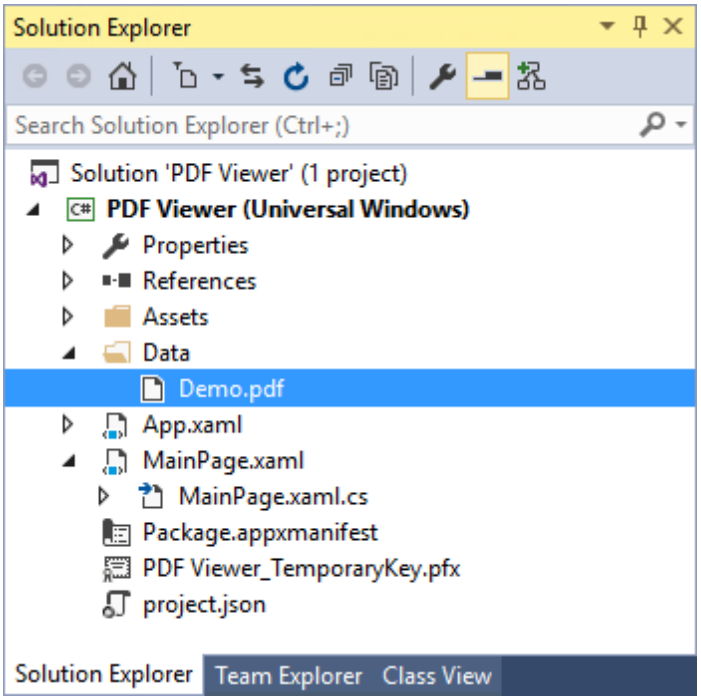
Note

To collect all assemblies that may be required for your application, use the Assembly Deployment Tool.

© 2018 Developer Express Inc.

The PDF Viewer is now in our application. Continue and specify the document to be loaded at the application start.

- Copy a file (e.g., **Demo.pdf**) to a subdirectory of your project and include this file into your solution.



- Set the PdfViewerControl.ShowOpenDocumentButton property to **true** to enable end-users to choose a document to open using the **Open** dialog window. Specify a path to the file you wish to load by using the PdfViewerControl.DocumentUri property. The XAML below shows how to do this for **Demo.pdf**.

Xaml

```
<my:PdfViewerControl ShowOpenDocumentButton="True" DocumentUri="ms-appx:///Data/Demo.pdf"/>
```

- Run the application.

Visual Elements

Topics in this section:

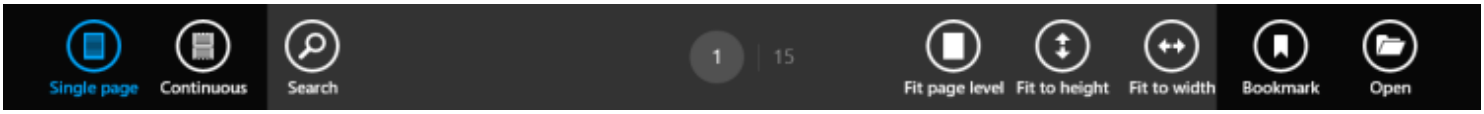
- Settings Bar
- Search Panel
- Page Bar
- Zoom Bar
- Bookmarks Panel
- Attachments Panel

© 2018 Developer Express Inc.

Settings Bar

The **Settings Bar** is a control panel that allows end-users to specify zoom and view mode settings, view and change the current page number, insert a bookmark, and invoke the Search Panel or the file picker.

To invoke the **Settings Bar**, right-click or tap anywhere within the **PDF Viewer**.



Below are the main properties that affect element appearance and functionality.

Availability	PdfOverlaySettingsBase.IsSettingsBarVisible
Elements	PdfViewerControl.ShowBookmarksButton PdfViewerControl.ShowLeftSideDefaultSettingsBarItems PdfViewerControl.ShowRightSideDefaultSettingsBarItems PdfViewerControl.ShowSaveDocumentButton PdfViewerControl.ShowOpenDocumentButton PdfViewerControl.ShowPrintDocumentButton
Associated Commands	PdfViewerControl.FitSizeCommand PdfViewerControl.PrintDocumentCommand PdfViewerControl.SetPageNumberCommand PdfViewerControl.SetViewModeCommand PdfViewerControl.SetZoomModeCommand PdfViewerControl.ShowFindPanelCommand PdfViewerControl.LoadDocumentCommand PdfViewerControl.SaveAsCommand PdfViewerControl.NextPageCommand PdfViewerControl.PreviousPageCommand PdfViewerControl.OpenAttachmentCommand PdfViewerControl.SaveAttachmentCommand

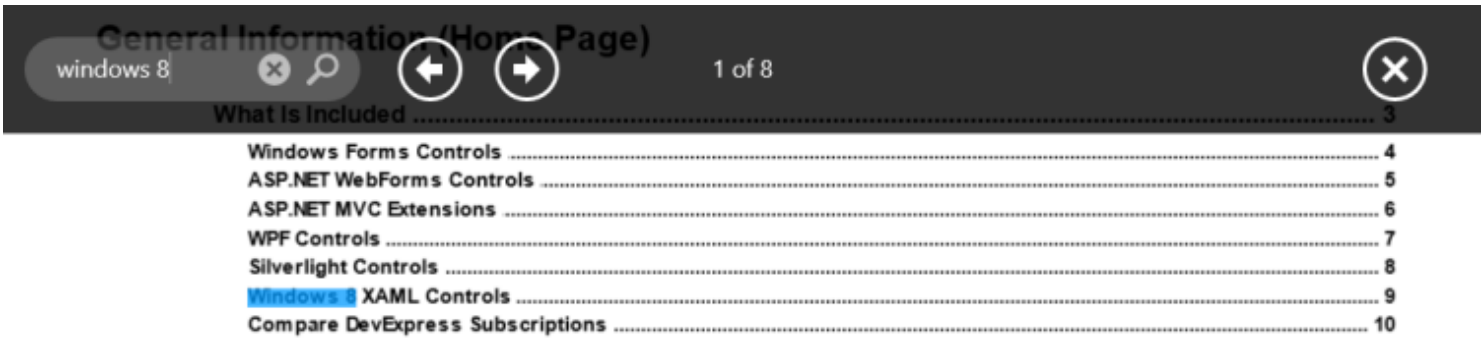
© 2018 Developer Express Inc.

Search Panel

Windows 10 App Controls > Controls > PDF Viewer > Visual Elements > Search Panel

The **Search Panel** allows an end-user to find text within a document. The text that matches the search criteria is highlighted.

To invoke the **Search Panel**, press **Ctrl**+**F** or click the **Search** button on the Settings Bar.



Below are the main properties that affect element appearance and functionality.

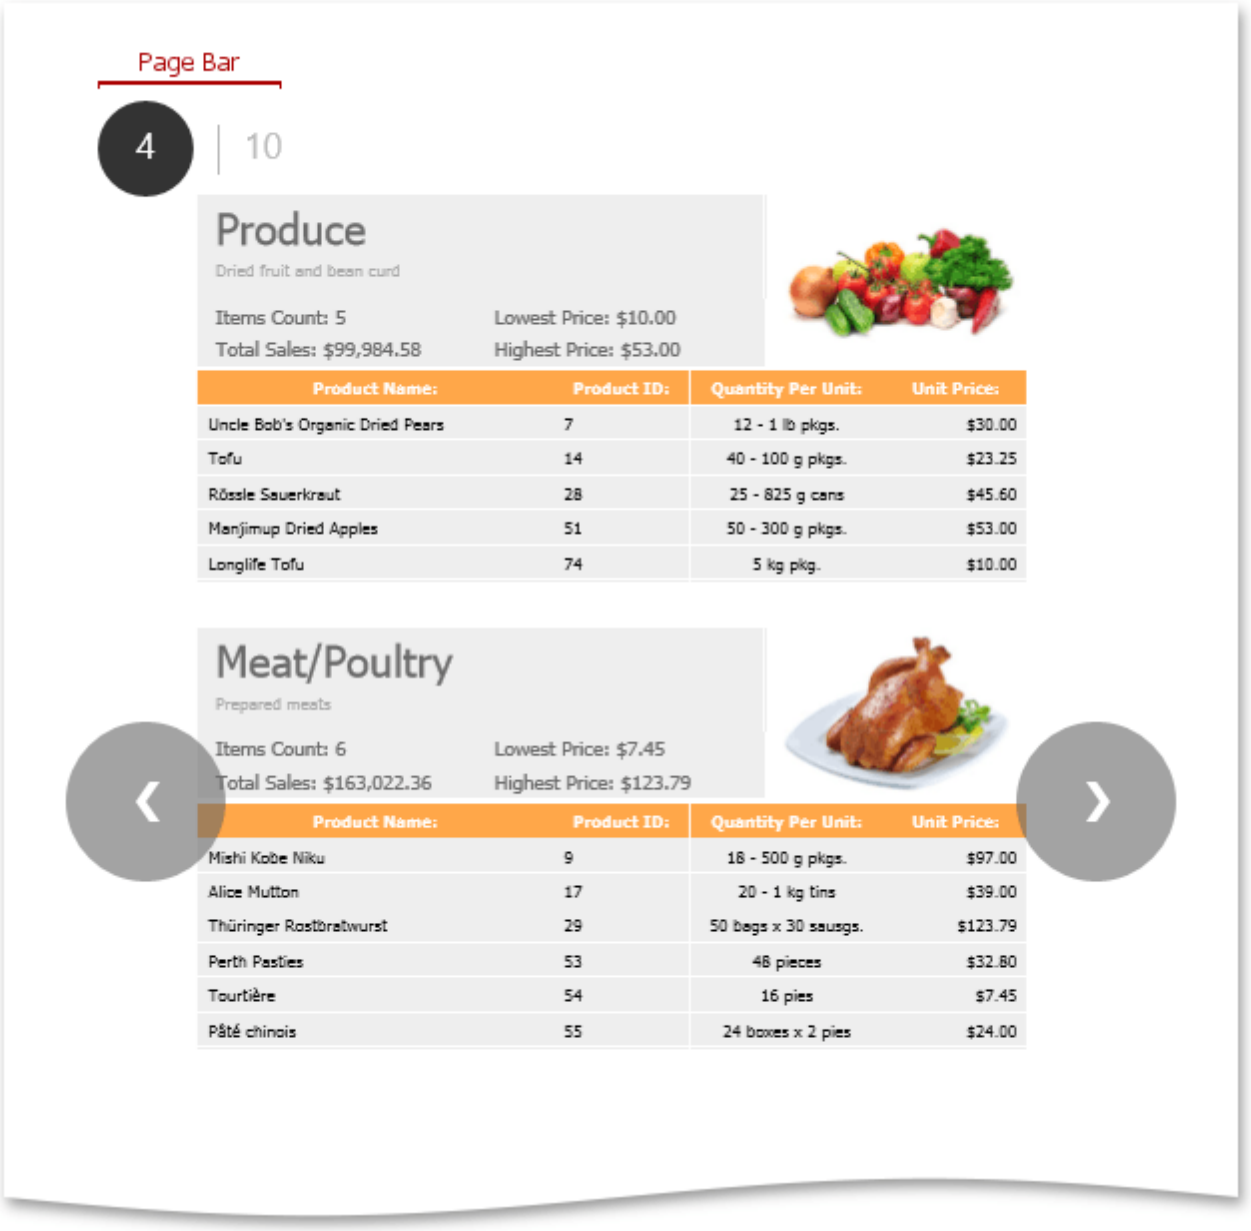
Availability	PdfOverlaySettingsBase.IsFindPanelVisible
Associated Commands	PdfViewerControl.ClearFindResultsCommand, PdfViewerControl.CloseFindPanelAndClearFindResultsCommand, PdfViewerControl.FindNextTextCommand, PdfViewerControl.FindPreviousTextCommand, PdfViewerControl.FindTextCommand

© 2018 Developer Express Inc.

Page Bar

Windows 10 App Controls > Controls > PDF Viewer > Visual Elements > Page Bar

The **Page Bar** displays the current page number and the total number of pages in the document. It appears for a time specified by the PdfOverlaySettingsBase.HidePageBarDelay property when the current page changes.



Below are the main properties that affect element appearance and functionality.

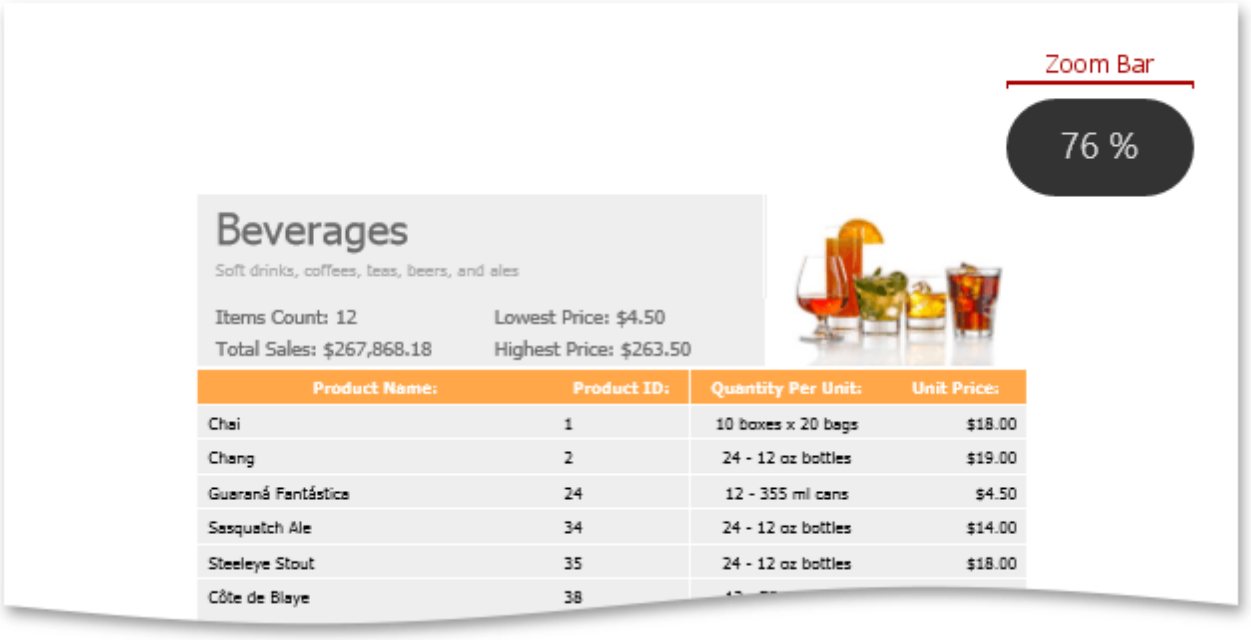
Availability	PdfOverlaySettingsBase.IsPageBarVisible
Values	PdfViewerControl.CurrentPageNumber, PdfViewerControl.PageCount

© 2018 Developer Express Inc.

Zoom Bar

Windows 10 App Controls > Controls > PDF Viewer > Visual Elements > Zoom Bar

The **Zoom Bar** displays the current zoom level. It appears for a time specified by the PdfOverlaySettingsBase.HideZoomBarDelay property when the current zoom factor changes.



Below are the main properties that affect element appearance and functionality.

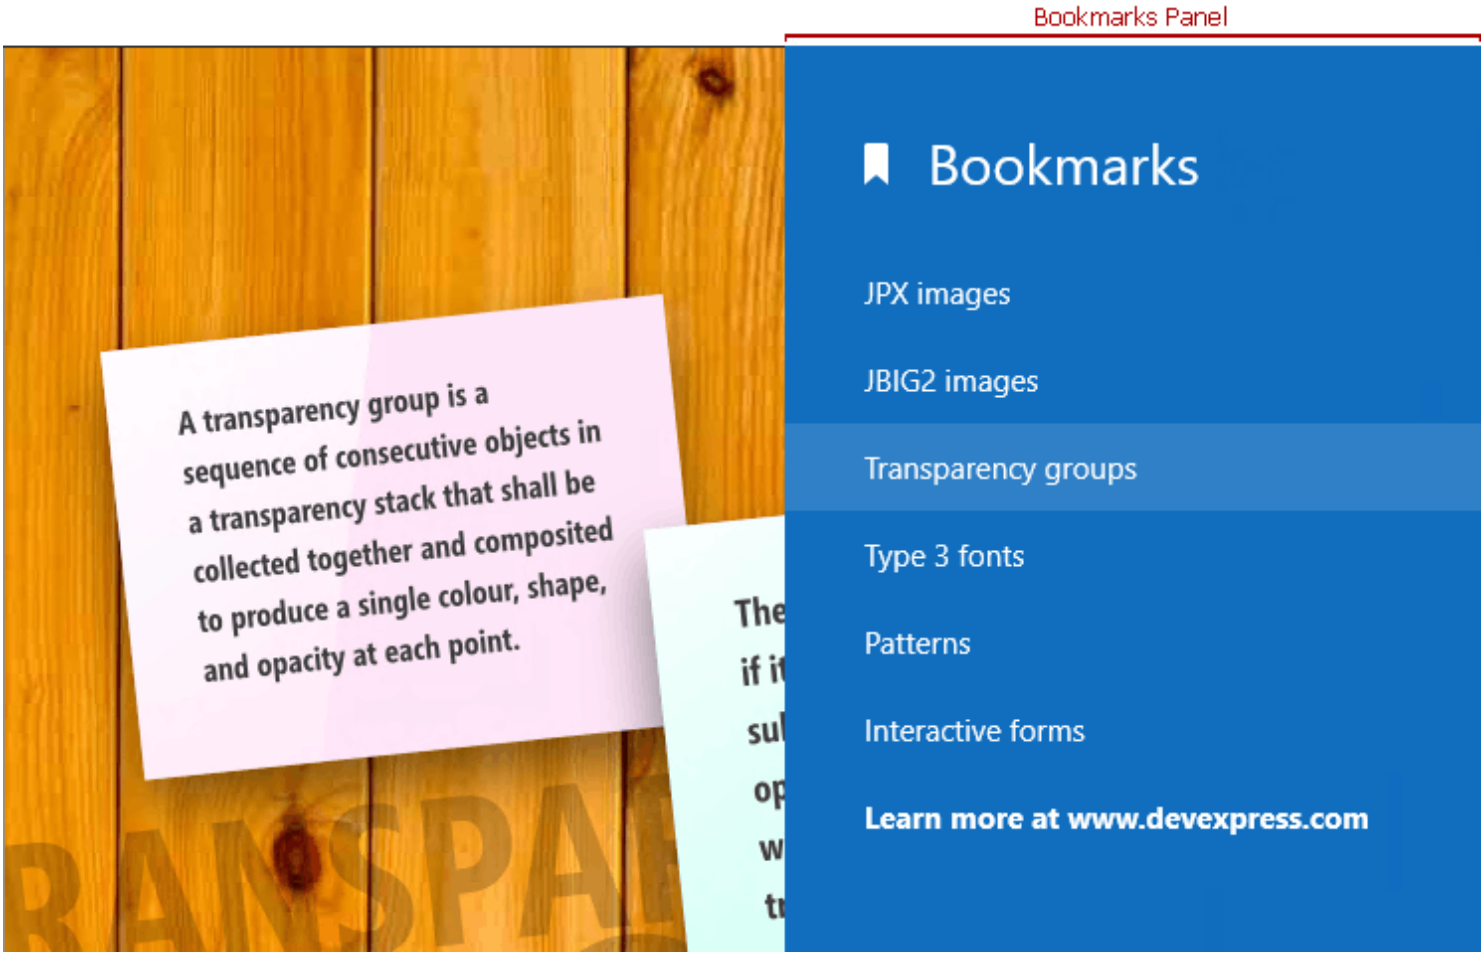
Availability	PdfOverlaySettingsBase.IsZoomBarVisible
Values	PdfViewerControl.CurrentZoomFactor

© 2018 Developer Express Inc.

Bookmarks Panel

Windows 10 App Controls > Controls > PDF Viewer > Visual Elements > Bookmarks Panel

The **Bookmarks Panel** displays bookmarks for the current PDF document, so end-users can navigate quickly from one document part to another. End-users can invoke the panel by selecting the **Bookmarks** Settings Bar item. If the current document does not contain bookmarks, the item is disabled.



Below are the main properties that affect element appearance and functionality.

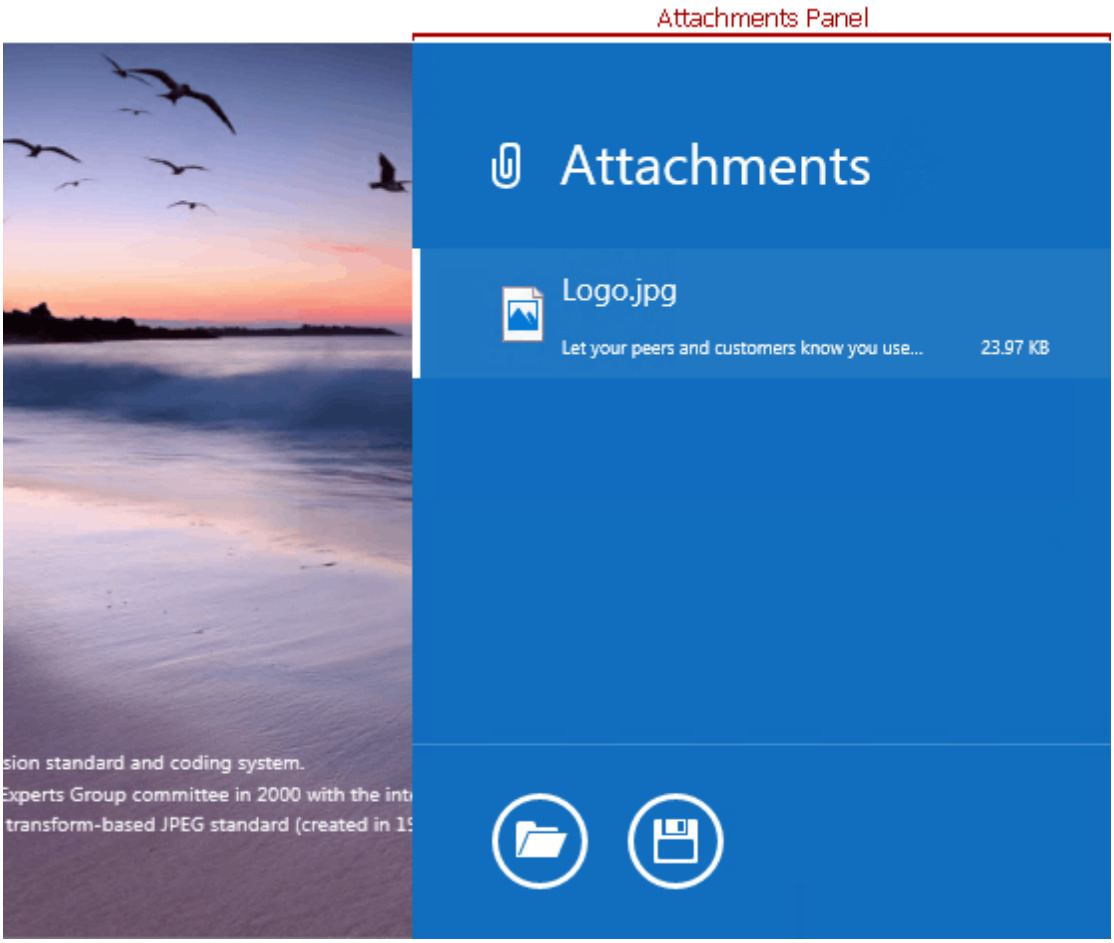
Availability	PdfOverlaySettingsBase.ShowBookmarksButton
Visibility	PdfOverlaySettingsBase.IsBookmarksPanelVisible

© 2018 Developer Express Inc.

Attachments Panel

Windows 10 App Controls > Controls > PDF Viewer > Visual Elements > Attachments Panel

The **Attachments Panel** displays files that are attached to the currently opened PDF document. End-users can invoke the panel by selecting the **Attachments** Settings Bar item. If the current document does not contain attached files, the item is disabled.



Below are the main properties that affect element appearance and functionality.

Availability	PdfOverlaySettingsBase.ShowAttachmentsButton
Visibility	PdfOverlaySettingsBase.IsAttachmentsPanelVisible

© 2018 Developer Express Inc.

SVG Icon

The SvgIcon control allows you to display SVG images in your applications.

Specify the image source using the SvgIcon.Source property. The SvgIcon.IconStretch property allows you to specify how the image is resized to fill its allocated space.

Supported SVG elements

- Rectangle <rect>
- Circle <circle>
- Ellipse <ellipse>
- Line <line>
- Polyline <polyline>
- Polygon <polygon>
- Path <path>
- The transform attribute
- The 'style' attribute
- The 'opacity' attribute

Supported stroke and fill properties:

- stroke
- stroke-width
- fill

The stroke and stroke-width properties can be applied to any kind of lines and outlines of elements.

Limitations

The following SVG elements are currently not supported.

- Size in millimeters and other units except pixels
- The 'text' element

© 2018 Developer Express Inc.

Context Menu

Windows 10 App Controls > Controls > Context Menu

The Context Menu is a flyout menu that can be invoked by right-clicking or pressing and holding a UI element. It provides end-users with the ability to perform actions linked to this element.

Context Menus are represented by the ContextMenu class. You can add a context menu to any UI element using the ContextMenu.Menu attached property. The ContextMenu.Content property specifies the flyout content that can be represented by a Windows.UI.Xaml.UIElement descendant or Windows.UI.Xaml.DataTemplate instance.

Use the ContextMenu.Header property to specify the menu header.

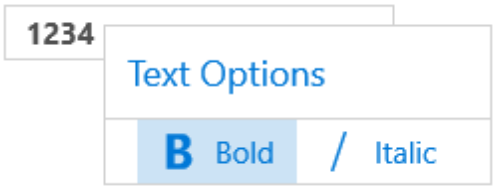
The example below illustrates how to add a text formatting menu to a native TextBox.

Xaml

```
        <TextBox Name="textBox">
            <xaml:ContextMenu.Menu>
                <xaml:ContextMenu Header="Text Options" Closed="ContextMenu_Closed">
                    <ribbon:ContextToolbarControl >
                        <ribbon:ContextToolbarGroup>
                            <ribbon:ContextToolbarToggleButton Content="Bold" Name="boldButton" >
                                <ribbon:ContextToolbarToggleButton.Icon>
                                    <SymbolIcon Symbol="Bold" />
                                </ribbon:ContextToolbarToggleButton.Icon>
                            </ribbon:ContextToolbarToggleButton>
                            <ribbon:ContextToolbarToggleButton Content="Italic" Name="italicButton" >
                                <ribbon:ContextToolbarToggleButton.Icon>
                                    <SymbolIcon Symbol="Italic" />
                                </ribbon:ContextToolbarToggleButton.Icon>
                            </ribbon:ContextToolbarToggleButton>
                        </ribbon:ContextToolbarGroup>
                    </ribbon:ContextToolbarControl>
                </xaml:ContextMenu>
            </xaml:ContextMenu.Menu>
        </TextBox>
```

C#

```
using Windows.UI.Text;
private void ContextMenu_Closed(object sender, EventArgs e) {
    textBox.FontWeight = (bool)boldButton.IsChecked ? FontWeights.Bold : FontWeights.Normal;
    textBox.FontStyle = (bool)italicButton.IsChecked ? FontStyle.Italic : FontStyle.Normal;
}
```



The Data Grid and Hamburger Menu provide built-in context menus. To learn more, see Data Grid Context Menus and Hamburger Menu Context Menus.

Themes and Color Schemes

Windows 10 App Controls > Themes and Color Schemes

Topics in this section:

- Color Scheme Customization
- Automatic Template Overriding for Default Controls

© 2018 Developer Express Inc.

Color Scheme Customization

Windows 10 App Controls > Themes and Color Schemes > Color Scheme Customization

This document describes how to customize the color scheme of your application.

- Overriding Colors
- Creating Custom Themes
- Using DevExpress Brushes in Resources
- Using the AccentColorizer Class

Overriding Colors

The DevExpress.Core.ThemeManager.GenericColorScheme.AllScopes property provides access to color settings for individual elements of all DevExpress Universal controls. A color setting is represented by the DevExpress.Themes.ColorSet object that specifies two colors corresponding to the Default and Light UI themes (to learn more, see the ElementTheme topic on MSDN). To override a default color setting, assign the desired value in the **App** constructor before the **InitializeComponent** method. A color can be represented by the Windows.UI.Color object or its hexadecimal value. If you set a color setting to a color value, the value is assigned both to the Default and Light colors. The code snippet below illustrates how to override default colors.

C#

```
using DevExpress.Core;
using DevExpress.Themes.ColorKeys;
//...
sealed partial class App : Application {
    public App() {
        //both Default and Light colors are set to Black
        ThemeManager.GenericColorScheme.AllScopes.WindowTitleColors
            [WindowTitleColorKeys.Background] = Windows.UI.Colors.Black;
        //the Light color is set to the first parameter of the ColorSet constructor, the Default color is
        ThemeManager.GenericColorScheme.AllScopes.WindowTitleColors
            [WindowTitleColorKeys.Foreground] = new DevExpress.Themes.ColorSet(0xFFFF8080, 0xFFFF1010);
        //the Light and Default colors are set explicitly
        ThemeManager.GenericColorScheme.AllScopes.RibbonControlColors
            [RibbonControlColorKeys.Background].Default = 0xFF008000;
        ThemeManager.GenericColorScheme.AllScopes.RibbonControlColors
            [RibbonControlColorKeys.Background].Light = Windows.UI.Colors.Green;
        this.InitializeComponent();
        this.Suspending += OnSuspending;
    }
    //...
}
```

Creating Custom Themes

To create a custom theme, follow these steps.

- Create a DevExpress.Themes.Generic.GenericColorScheme descendant and override its **Initialize** method. In the method's implementation, call the **base.Initialize** method to initialize base color scopes and then override default colors.

C#

```
class GreenTitleColorScheme : GenericColorScheme {
    public GreenTitleColorScheme (string name) : base(name) { }
    protected override void Initialize() {
        base.Initialize();
        AllScopes.WindowTitleColors[WindowTitleColorKeys.Background] = Colors.Green;
    }
}
```

- Use the DevExpress.Core.ThemeManager.RegisterColorScheme method to register the new theme. To apply the new theme, set the ThemeManager.CurrentColorSchemeName property to the name of the custom theme.

C#

```
ThemeManager.RegisterColorScheme(new GreenTitleColorScheme("GreenTitleColorScheme"));
ThemeManager.CurrentColorSchemeName = "GreenTitleColorScheme";
```

© 2018 Developer Express Inc.

Using DevExpress Brushes in Resources

The DevExpress.Core.ColorKey.Link attached property allows you to set a Brush value in the Resources to a color used by the DevExpress Universal control.

The example below illustrates how to set the ContentControl's **Foreground** to different colors used by DevExpress controls depending on the current theme.

Xaml

```
<ResourceDictionary>
    <ResourceDictionary.ThemeDictionaries>
        <ResourceDictionary x:Key="Light">
            <SolidColorBrush x:Key="ForegroundBrush" Core:ColorKey.Link="DateNavigatorColors.DecorationToo
        </ResourceDictionary>
        <ResourceDictionary x:Key="Default">
            <SolidColorBrush x:Key="ForegroundBrush" Core:ColorKey.Link="RatingEditColors.ItemHovered.Defa
        </ResourceDictionary>
    </ResourceDictionary.ThemeDictionaries>
</ResourceDictionary>
<!---->
<ContentControl Foreground="{ThemeResource ForegroundBrush}" >
    <!---->
</ContentControl>
```

Using the AccentColorizer Class

The DevExpress.Core.AccentColorizer class allows you to customize the color scheme of all DevExpress controls in your application based on a specified accent color.

To change the current accent color, use the Apply method.

C#

```
DevExpress.Core.AccentColorizer.Apply(Windows.UI.Colors.BurlyWood);
```

© 2018 Developer Express Inc.

Automatic Template Overriding for Default Controls

When DevExpress assemblies are being loaded, our theming mechanism automatically loads custom templates for default controls and applies them. This behavior provides a consistent appearance of stock and DevExpress controls.

The following controls are affected:

- Windows.UI.Xaml.Controls.Button
- Windows.UI.Xaml.Controls.CheckBox
- Windows.UI.Xaml.Controls.ComboBox
- Windows.UI.Xaml.Controls.HyperlinkButton
- Windows.UI.Xaml.Controls.ListBox
- Windows.UI.Xaml.Controls.ProgressBar
- Windows.UI.Xaml.Controls.ProgressRing
- Windows.UI.Xaml.Controls.RadioButton
- Windows.UI.Xaml.Controls.Primitives.ScrollBar
- Windows.UI.Xaml.Controls.Slider
- Windows.UI.Xaml.Controls.TextBox
- Windows.UI.Xaml.Controls.Primitives.ToggleButton
- Windows.UI.Xaml.Controls.ToggleSwitch

To prevent custom templates from being applied, set the **DevExpress.Core.ThemeManager.OverrideSystemControlTemplates** static property to **false** in the application's constructor.

C#

```
sealed partial class App : Application {
        public App() {
              ThemeManager.OverrideSystemControlTemplates = false;
              ...
        }
...
```

Visual Basic

```
NotInheritable Class App
    Inherits Application
        Public Sub New()
              ThemeManager.OverrideSystemControlTemplates = False
             ...
        End Sub
...
```

© 2018 Developer Express Inc.

Localization

Windows 10 App Controls > Localization

The following DevExpress Win10 App controls display built-in strings that can be localized into various languages.

- ColorEdit
- GridControl
- PdfViewerControl

Control strings can be localized in code and by using resources.

Localizing in Code

Use the **DevExpress.Core.Localization.Localizer** class to localize a control's built-in text in code. This class provides the **AddString** static method that allows you to add a control's localized string for a specific language.

C#

```
public sealed partial class App : Application {
    static App() {
        Localizer.AddString("de", PdfViewerStringID.OpenButtonText, "Öffnen");
    }
}
```

The first parameter of the **AddString** method specifies the name of the target language. A list of supported language names can be found in MSDN at: Choosing your languages.

The second parameter is the identifier of a string to be translated. The following enumerators contain available string identifiers.

- DevExpress.Core.Localization.GridStringID - Enumerates localizable strings for the GridControl
- DevExpress.Core.Localization.PdfViewerStringID - Enumerates localizable strings for the PdfViewerControl

The third parameter of the **AddString** method specifies the translated string.

Tip

There is an **AddString** method overload that does not require the target language name to be specified. A translated string provided with this method will be used in all cases that require the default string.

C#

```
Localizer.AddString(PdfViewerStringID.OpenButtonText, "Öffnen");
```

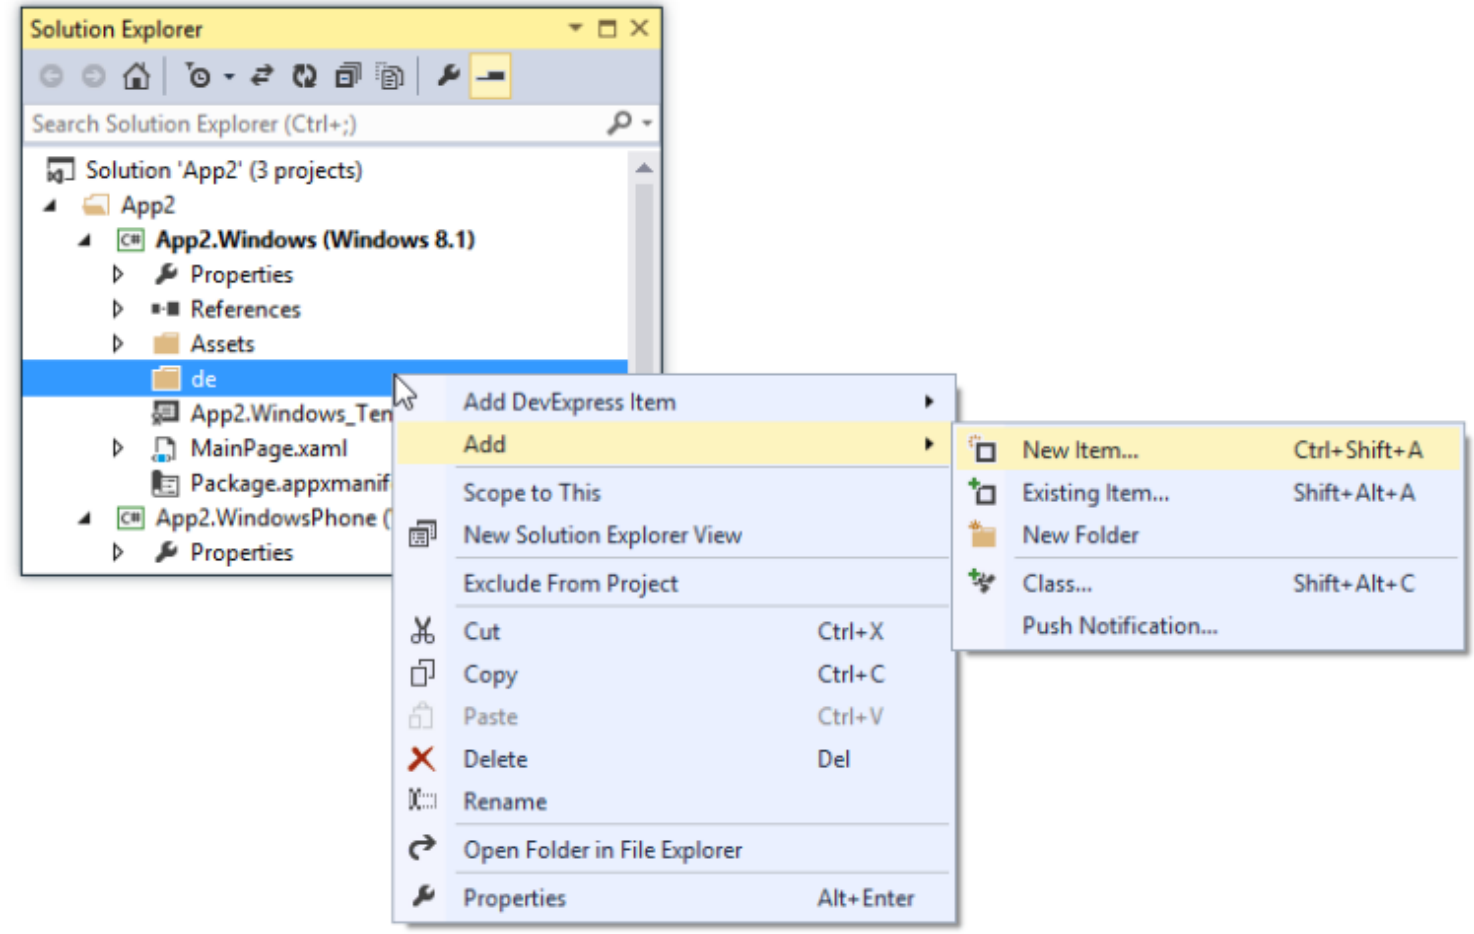
The **Localizer.AddString** method needs to be called before a localizable control is created. The best place to add localized strings is a static constructor of your Application or Page class.

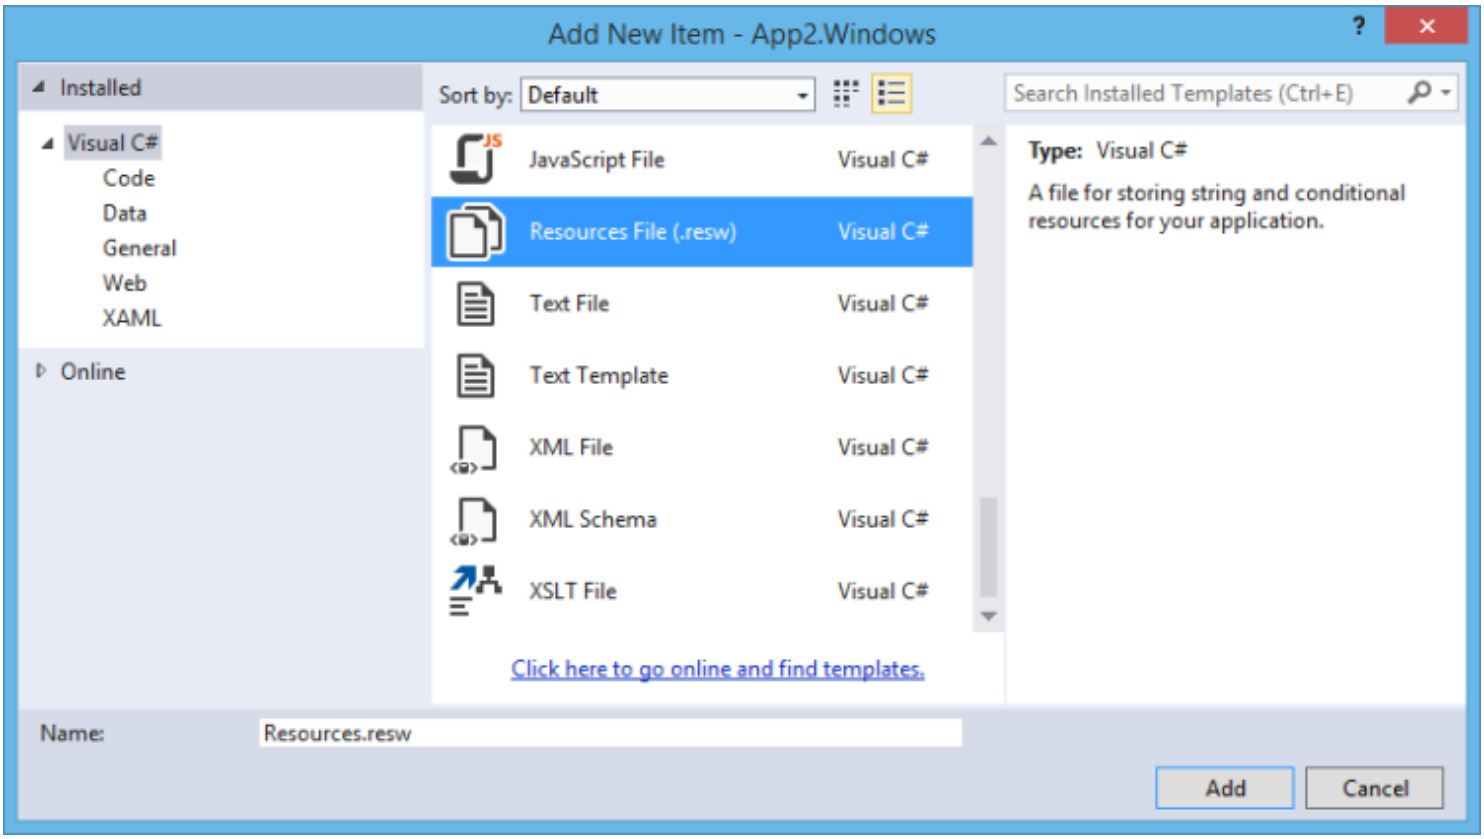
Localizing by using Project Resources

You can define localized strings in resources as follows.

1. Add a folder to your project and give it a name matching the target language name.
2. Add a resource file to this project with the **Add->New Item...** command, which is available from the folder's context menu.

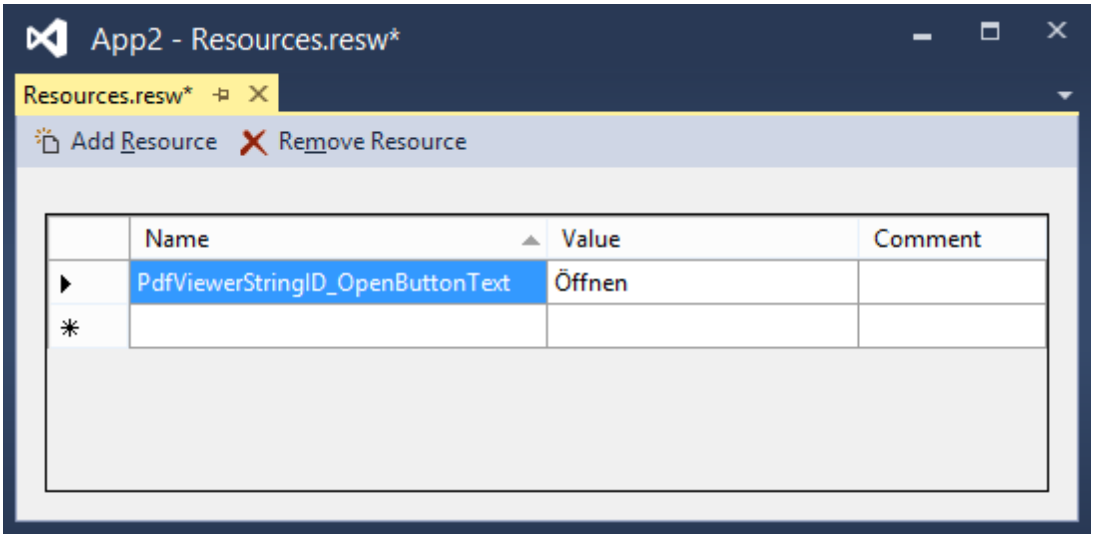
© 2018 Developer Express Inc.





3. Add localizable strings to this resource file.

© 2018 Developer Express Inc.



The resource name should identify the localizable string in the form: EnumName_EnumValue. The enumerators that identify localizable strings are listed in the section above.

4. Enable the use of this resource file with the **DevExpress.Core.Localization.Localizer.EnableResourceStrings** static property.

C#

```
public sealed partial class App : Application {
    static App() {
        Localizer.EnableResourceStrings = true;
        //...
    }
}
```

This property needs to be set before a localizable control is created (for instance, in a static constructor of your Application or Page class).

Localized Resources Priority

The DevExpress localization mechanism searches for translated strings in the following order.

1. Strings that were added by the **Localizer.AddString** method with the target language name specified.
2. Strings in resource files (if the **Localizer.EnableResourceStrings** property is enabled).
3. Default strings that were added by the **Localizer.AddString** method overload without the parameter identifying the target language name.

Get More Help

Windows 10 App Controls > Get More Help

To help you better use our software, we provide numerous resources describing the best practices for using our controls in real-life applications, as well as different support options to help you solve specific tasks.

Please choose an appropriate option from the list below.

Overview

- Get Started with DevExpress

Choose a platform and view our online tutorials, videos and product documentation.

- Online Demos

Choose a platform and view and/or download all available demos.

- YouTube Video Channel

Subscribe to our video channel to receive first-hand information from DevExpress and explore the featured video content.

Help Resources

- Online Documentation

Explore the latest edition of the official documentation that is supplied with DevExpress products.

- Code Examples

Discover hundreds of real-world applications that showcase DevExpress products in various settings and provide robust and reusable code.

- DevExpress Search

Rely on a custom search engine to find information about a specific product or technology among varied sources.

- Support Center

For direct and urgent assistance, submit an issue in our Support Center or send an e-mail to support@devexpress.com. When reporting a bug, we would greatly appreciate detailed, step-by-step instructions on how to reproduce it, along with a sample project localizing this issue.

Advanced Learning

- Webinars

Join us online and learn more about DevExpress products.

- Classroom Training

Check for upcoming workshops scheduled near your location.

- Online Training Center

Sign up for our complete online training courses to get the most out of DevExpress products.

Community Resources

- Blogs

Keep up with industry news and receive the latest information from DevExpress.

- Events and Tradeshows

Join DevExpress at an upcoming industry gathering.

Sales Questions

If you have not found a required information in DevExpress Licensing FAQ, please use the following options to contact our Sales Department with questions related to licensing and any other non-technical issues.

- info@devexpress.com

Write here to ask questions regarding your purchase or any other basic questions about DevExpress products. This service is also available by phone:
Tel: + 1 (818) 844 3383
Fax: + 1 (818) 844 3389

- clientservices@devexpress.com

Contact us at this address to ask about product pricing, pending orders, billing inquiries or any other corporate communications. This service is also available by phone:

API Reference

DevExpress.Core

Contains types implementing functionality that is common to all DevExpress Windows 10 App Controls.

Classes

	Class	Description
	ElementSelectionChangedEventArgs	Provides data for selection changed events (e.g., ChartBase.SelectionChanged or MapControl.SelectionChanged).

Interfaces

	Interface	Description
	ISupportNavigationEvents	Provides methods that are called during navigation to a DXPage.

Delegates

	Delegate	Description
	ElementSelectionChangedEventHandler	A method that will handle the selection changed event (e.g., ChartBase.SelectionChanged or MapControl.SelectionChanged).

Enumerations

	Enumeration	Description
	ElementSelectionMode	Defines the selection behavior for DevExpress controls.

© 2018 Developer Express Inc.

ElementSelectionChangedEventArgs Class

Provides data for selection changed events (e.g., ChartBase.SelectionChanged or MapControl.SelectionChanged).

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Class ElementSelectionChangedEventArgs Inherits EventArgs
```

C#

```
public class ElementSelectionChangedEventArgs : EventArgs
```

Remarks

An instance of the **ElementSelectionChangedEventArgs** class with appropriate settings is automatically created and passed to the corresponding event's handler.

Inheritance Hierarchy

System.Object
  System.EventArgs
    ElementSelectionChangedEventArgs

ElementSelectionChangedEventArgs Members

Provides data for selection changed events (e.g., ChartBase.SelectionChanged or MapControl.SelectionChanged).

The following tables list the members exposed by the ElementSelectionChangedEventArgs type.

Public Constructors

	Name	Description
	ElementSelectionChangedEventArgs	Initializes a new instance of the ElementSelectionChangedEventArgs class with the specified selection.

Public Properties

	Name	Description
	Selection	Returns the list of currently selected objects.

Public Methods

	Name	Description
	Equals	(Inherited from **System.Object**)
	Equals	(Inherited from **System.Object**)
	GetHashCode	(Inherited from **System.Object**)
	GetType	(Inherited from **System.Object**)
	ReferenceEquals	(Inherited from **System.Object**)
	ToString	(Inherited from **System.Object**)

Public Fields

	Name	Description
	Empty	(Inherited from **System.EventArgs**)

ElementSelectionChangedEventArgs Constructor

Initializes a new instance of the ElementSelectionChangedEventArgs class with the specified selection.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal selection As List(of Object)
)
```

C#

```
public ElementSelectionChangedEventArgs(
   List<Object> selection
)
```

Parameters

selection
A list of objects specifying the current selection. This value is assigned to the Selection property.

Remarks

Instances of the ElementSelectionChangedEventArgs class are automatically created, initialized and passed to the corresponding event handlers.

Selection Property

Returns the list of currently selected objects.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property Selection As List(of Object)
```
C#
```
public List<Object> Selection { get; }
```

Property Value

A List<Object> object.

ElementSelectionChangedEventHandler Delegate

A method that will handle the selection changed event (e.g., ChartBase.SelectionChanged or MapControl.SelectionChanged).

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Delegate Sub ElementSelectionChangedEventHandler(
   ByVal sender As Object,
   ByVal e As ElementSelectionChangedEventArgs
)
```

C#

```
public delegate void ElementSelectionChangedEventHandler(
   object sender,
   ElementSelectionChangedEventArgs e
)
```

Parameters

The declaration of your event handler must have the same parameters as the **ElementSelectionChangedEventHandler** delegate declaration.
sender
The event source.
e
An ElementSelectionChangedEventArgs object that contains event data.

Remarks

When creating a ElementSelectionChangedEventHandler delegate, you identify the method that will handle the corresponding event. To associate an event with your event handler, add a delegate instance to this event. The event handler is called whenever the event occurs, unless you remove the delegate. For more information about event handler delegates, see **Events and Delegates** in **MSDN**.

ElementSelectionMode Enumeration

Defines the selection behavior for DevExpress controls.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Enum ElementSelectionMode
```
C#
```
public enum ElementSelectionMode
```

Members

Name	Description
Extended	The user can select multiple consecutive items while holding down the SHIFT key.
Multiple	The user can select multiple items without holding down a modifier key.
None	Selection is disabled.
Single	The user can select only one item at a time.

ISupportNavigationEvents Interface

Provides methods that are called during navigation to a DXPage.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Interface ISupportNavigationEvents
```

C#

```
public interface ISupportNavigationEvents
```

Remarks

The **ISupportNavigationEvents** interface provides the OnNavigating and OnNavigated methods that allow you to customize the default navigation logic. To use these methods, implement the **ISupportNavigationEvents** interface for your ViewModels as follows:

C#

```
public class ViewModel : DevExpress.Core.ISupportNavigationEvents {
    // ISupportNavigationEvents implementation
    public void OnNavigated(DevExpress.Core.DXNavigationEventArgs e) {
    }
    public void OnNavigating(DevExpress.Core.DXNavigatingCancelEventArgs e) {
    }
}
```

Visual Basic

The **OnNavigating** method is called before a page with a ViewModel implementing the ISupportNavigationEvents interface is unloaded from the parent frame. To prevent the page from being unloaded, set the **e.Cancel** property to **true**.

If the **OnNavigating** method's **e.Cancel** parameter does not equal **true**, the current page is unloaded and then the OnNavigated method belonging to a ViewModel of the newly loaded page is called.

Note

To ensure **ISupportNavigationEvents** interface methods are called on the ViewModel, the DXPage has to be used instead of a regular Page.

Inheritance Hierarchy

OnNavigated Method

Called automatically when a page with a ViewModel that implements the ISupportNavigationEvents interface is loaded into the parent frame.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Sub OnNavigated(
   ByVal e As DXNavigationEventArgs
)
```

C#

```
void OnNavigated(
   DXNavigationEventArgs e
)
```

Parameters

e
A **DXNavigationEventArgs** object that contains event data.

Remarks

The **OnNavigated** method is called only if the OnNavigating method's **e.Cancel** parameter does not equal true.

See Also

ISupportNavigationEvents Interface

DevExpress.Core Namespace
OnNavigating

© 2018 Developer Express Inc.

OnNavigating Method

Called automatically before a page with a ViewModel implementing the ISupportNavigationEvents interface is unloaded from the parent frame.

Namespace: DevExpress.Core
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Sub OnNavigating(
   ByVal e As DXNavigatingCancelEventArgs
)
```

C#

```
void OnNavigating(
   DXNavigatingCancelEventArgs e
)
```

Parameters

e
A **DXNavigatingCancelEventArgs** object that contains event data.

Remarks

To prevent the page from being unloaded, set the **e.Cancel** property to **true**.

If the **OnNavigating** method's **e.Cancel** parameter does not equal **true**, the current page is unloaded and then the OnNavigated method belonging to a ViewModel of the newly loaded page is called.

DevExpress.Data

Contains classes implementing the common data management functionality for DevExpress controls.

Classes

	Class	Description
	CustomSummaryEventArgs	Provides data for the GridControl.CustomSummary event.
	CustomSummaryExistEventArgs	Provides data for the GridControl.CustomSummaryExists event.

Delegates

	Delegate	Description
	CustomSummaryEventHandler	Represents a method that will handle the GridControl.CustomSummary event.
	CustomSummaryExistEventHandler	Represents a method that will handle the GridControl.CustomSummaryExists event.

Enumerations

	Enumeration	Description
	ColumnSortOrder	Lists values specifying the sort orders.
	CustomSummaryProcess	Specifies the current status of a custom summary calculation.
	SummaryItemType	Lists values specifying the aggregate function types.
	UnboundColumnType	Contains values that specify the data type and binding mode of columns.

© 2018 Developer Express Inc.

ColumnSortOrder Enumeration

Lists values specifying the sort orders.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Enum ColumnSortOrder
```
C#
```
public enum ColumnSortOrder
```

Members

Name	Description
Ascending	Sorts the column in ascending order.
Descending	Sorts the columns in descending order.
None	No sorting is applied to a column.

Remarks

Values listed by this enumeration apply data sorting in a particular order or cancel any sorting applied.

See Also
DevExpress.Data Namespace

© 2018 Developer Express Inc.

CustomSummaryEventArgs Class

Provides data for the GridControl.CustomSummary event.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Class CustomSummaryEventArgs Inherits EventArgs
```

C#

```
public class CustomSummaryEventArgs : EventArgs
```

Remarks

The GridControl.CustomSummary event enables you to calculate summary values manually. This event is raised for each data row involved in the calculations, it also fires before and after calculations allowing you to perform any initialization and finalization required. The **CustomSummaryEventArgs** class introduces the SummaryProcess property that identifies whether initialization, finalization or total summary value calculation should be performed.

When calculating, read the FieldValue property value to obtain the currently processed field value. If you need the values of other fields, use the RowHandle property. It enables you to identify the current row and, thus, obtain its values. The total summary value should be accumulated in the TotalValue property.

If calculating a group summary value, you may need the GroupLevel and GroupRowHandle properties to identify the currently processed group. You can determine whether a group summary will be calculated using the IsGroupSummary property value.

Use the Item property to access the summary item that provides the settings for the summary calculation.

Public Constructors

	Name	Description
	CustomSummaryEventArgs	Overloaded. Creates a new CustomSummaryEventArgs object.

Public Properties

	Name	Description
	FieldValue	Gets the processed field value.
	GroupLevel	Gets the nesting level of the group whose summary value is being calculated.
	GroupRowHandle	Gets a value identifying the group row whose child data rows are involved in summary calculation.
	IsGroupSummary	Gets whether a group summary value is being calculated.
	IsTotalSummary	Gets whether a total summary value is being calculated.
	Item	Gets a summary item whose value is being calculated.
	RowHandle	Gets the handle of the processed row.
	SummaryProcess	Gets a value indicating calculation stage.
	TotalValue	Gets or sets the total summary value.
	TotalValueReady	Gets or sets whether the calculation stage of the custom summary calculation process should be skipped.

Public Methods

	Name	Description
S	Equals	(Inherited from **System.Object**)
	Equals	(Inherited from **System.Object**)
	GetGroupSummary	Returns the value of the specified group summary for the specified group row.

CustomSummaryEventArgs Constructor (int, object, object, int, CustomSumm

Creates a new CustomSummaryEventArgs object.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal controllerRow As Integer,
   ByVal totalValue As Object,
   ByVal fieldValue As Object,
   ByVal groupRowHandle As Integer,
   ByVal summaryProcess As CustomSummaryProcess,
   ByVal item As Object,
   ByVal groupLevel As Integer
)
```

C#

```
public CustomSummaryEventArgs(
   int controllerRow,
   object totalValue,
   object fieldValue,
   int groupRowHandle,
   CustomSummaryProcess summaryProcess,
   object item,
   int groupLevel
)
```

Parameters

controllerRow
An integer value identifying the processed row by its handle. This value is assigned to the RowHandle property.
totalValue
An object representing the custom calculated summary value. This value is assigned to the TotalValue property.
fieldValue
An object representing the currently processed field value. This value is assigned to the FieldValue property.
groupRowHandle
An integer value identifying the group row whose child data rows are involved in summary calculation. This value is assigned to the GroupRowHandle property.
summaryProcess
A CustomSummaryProcess enumeration value identifying the current calculation stage. This value is assigned to the SummaryProcess property.
item
An object representing the summary item whose value is being calculated. This value is assigned to the Item property.
groupLevel
An integer value indicating the nested group level of the processed row. This value is assigned to the GroupLevel property.

FieldValue Property

Gets the processed field value.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property FieldValue As Object
```

C#

```
public object FieldValue { get; }
```

Property Value

An object representing the processed field value.

Remarks

Default summary calculation algorithms process values that belong to a field specified by a summary item. When calculating a summary value manually, this column's values are passed to corresponding event handlers via the **FieldValue** property. Use this property to access the processed value immediately and update the TotalValue property value accordingly.

Note that sometimes you may need to include several fields in your summary calculations. In this case, you will need to use the RowHandle parameter to identify the row being processed and access its values within the desired fields.

GroupLevel Property

Gets the nesting level of the group whose summary value is being calculated.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property GroupLevel As Integer
```

C#

```
public int GroupLevel { get; }
```

Property Value

An integer value representing the zero-based nesting level of the processed group.

Remarks

Reading this property is useful only when grouping is applied to data and a group summary item's value is being calculated. In other cases, the **GroupLevel** property returns **0**.

See Also

GroupRowHandle Property

Gets a value identifying the group row whose child data rows are involved in summary calculation.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property GroupRowHandle As Integer
```

C#

```
public int GroupRowHandle { get; }
```

Property Value

An integer value representing the handle of the group row containing the processed row as a child. **0** when calculating a total summary value.

IsGroupSummary Property

Gets whether a group summary value is being calculated.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Overridable Public ReadOnly Property IsGroupSummary As Boolean
```

C#

```
public virtual bool IsGroupSummary { get; }
```

Property Value

true if a group summary value is being calculated; otherwise, **false**.

IsTotalSummary Property

Gets whether a total summary value is being calculated.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Overridable Public ReadOnly Property IsTotalSummary As Boolean
```
C#
```
public virtual bool IsTotalSummary { get; }
```

Property Value

true if a total summary value is being calculated; otherwise, **false**.

IsGroupSummary

© 2018 Developer Express Inc.

Item Property

Gets a summary item whose value is being calculated.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property Item As Object
```

C#

```
public object Item { get; }
```

Property Value

An object representing a summary item whose value is being calculated.

Remarks

The actual type of returned object depends upon the control and summary type you use. Thus, you should typecast to access the summary item's specific settings.

See Also

RowHandle Property

Gets the handle of the processed row.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property RowHandle As Integer
```

C#

```
public int RowHandle { get; }
```

Property Value

An integer value identifying the processed data row by its handle.

Remarks

This property's return value can be passed to a method allowing you to obtain the processed row's data. Thus, you are not limited to using the FieldValue property only to accumulate the TotalValue.

SummaryProcess Property

Gets a value indicating calculation stage.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property SummaryProcess As CustomSummaryProcess
```

C#

```
public CustomSummaryProcess SummaryProcess { get; }
```

Property Value

A CustomSummaryProcess enumeration value indicating calculation stage.

See Also

TotalValue Property

Gets or sets the total summary value.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Property TotalValue As Object
```

C#

```
public object TotalValue { get; set; }
```

Property Value

An object representing the total summary value.

Remarks

The **TotalValue** property represents the total summary value that accumulates the custom calculated value. Note that this property should be initialized before the summary calculation process starts. To identify the status of the custom summary calculation, use the SummaryProcess property. When performing calculations, you need to refresh the **TotalValue** property for it to be updated with the new values.

You can also modify the **TotalValue** property's value when finalizing the calculation. In this case, the SummaryProcess property returns the CustomSummaryProcess.Finalize value.

TotalValueReady Property

Gets or sets whether the calculation stage of the custom summary calculation process should be skipped.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Property TotalValueReady As Boolean
```

C#

```
public bool TotalValueReady { get; set; }
```

Property Value

true if the calculation stage of the custom summary calculation process should be skipped; otherwise, **false**.

Remarks

Controls that support custom summary calculation provide a specific event. For instance, the Grid Control provides the GridControl.CustomSummary event.

By default, the process of custom summary calculation consists of three stages: Start, Calculation and Finalization. During the Start stage the calculation event fires once with the SummaryProcess parameter set to CustomSummaryProcess.Start. During the Calculation stage the event is called multiple times - once for each record. Finally, during the last stage the event is called once with the SummaryProcess parameter set to CustomSummaryProcess.Finalize.

The **TotalValueReady** property allows you to interrupt the process of summary calculation during the Start stage. You cannot interrupt the process in the other stages. This can be useful if you need to calculate a custom summary during the Start or Finalization stage while skipping the time-consuming Calculation stage.

If the **TotalValueReady** property is set to **true** the Calculation stage is skipped and the Finalization stage starts immediately (the summary calculation event will be called with the SummaryProcess parameter set to CustomSummaryProcess.Finalize).

GetGroupSummary Method

Returns the value of the specified group summary for the specified group row.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Function GetGroupSummary(
   ByVal groupRowHandle As Integer,
   ByVal summaryItem As Object
) As Object
```

C#

```
public object GetGroupSummary(
   int groupRowHandle,
   object summaryItem
)
```

Parameters

groupRowHandle
An integer that specifies a group row's handle.
summaryItem
An object representing the group summary item.

Return Value

The specified group summary's value.

Remarks

This method allows you to return group summary values for the summaries that have already been calculated. You can call this method when the SummaryProcess property returns CustomSummaryProcess.Finalize.

Group summaries are calculated in the order in which they have been specified. For instance, in the Grid Control, group summaries are calculated in the order specified by the position of the corresponding items in the GridControl.GroupSummary collection. If the **CustomSummaryCalculate** event is currently firing, say, for a third summary item, the **GetGroupSummary** method can be called to retrieve summary values for the first and second summary items, as they have already been calculated.

GetValue Method

Returns the value in the specified field.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Function GetValue(
   ByVal fieldName As String
) As Object
```
C#
```
public object GetValue(
   string fieldName
)
```

Parameters
fieldName
A string that identifies the field whose value must be returned.

Return Value

An object that represents the value of the specified field.

CustomSummaryEventHandler Delegate

Represents a method that will handle the GridControl.CustomSummary event.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Delegate Sub CustomSummaryEventHandler(
   ByVal sender As Object,
   ByVal e As CustomSummaryEventArgs
)
```

C#

```
public delegate void CustomSummaryEventHandler(
   object sender,
   CustomSummaryEventArgs e
)
```

Parameters

The declaration of your event handler must have the same parameters as the **CustomSummaryEventHandler** delegate declaration.
sender
The event source.
e
A CustomSummaryEventArgs object containing data related to the event.

Remarks

When creating a **CustomSummaryEventHandler** delegate, you identify the method that will handle the corresponding event. To associate an event with your event handler, add a delegate instance to this event. The event handler is called whenever the event occurs unless you remove the delegate.

CustomSummaryExistEventArgs Class

Provides data for the GridControl.CustomSummaryExists event.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Class CustomSummaryExistEventArgs Inherits EventArgs
```

C#

```
public class CustomSummaryExistEventArgs : EventArgs
```

Remarks

The GridControl.CustomSummaryExists event allows you to prevent certain summaries from being calculated and displayed. Thus, it is raised when a total summary is about to be calculated or when a group summary is about to be calculated for a particular group. Summary kind can be determined using the IsTotalSummary and IsGroupSummary properties of the event argument (a **CustomSummaryExistEventArgs** object). When processing a group summary, the group whose summary value is about to be calculated can be identified using the GroupRowHandle property. To prevent summary value calculations, set the Exists property to **false**.

Use the Item property to access the summary item providing summary calculation settings.

CustomSummaryExistEventArgs Constructor

Initializes a new instance of the CustomSummaryExistEventArgs class.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal groupRowHandle As Integer,
   ByVal groupLevel As Integer,
   ByVal item As Object
)
```

C#

```
public CustomSummaryExistEventArgs(
   int groupRowHandle,
   int groupLevel,
   object item
)
```

Parameters

groupRowHandle
An integer value specifying the handle of the group row whose summary value is about to be calculated. This value is assigned to the GroupRowHandle property.
groupLevel
An integer value specifying the zero-based nesting level of the processed group. This value is assigned to the GroupLevel property.
item
An object which represents the summary item whose value is about to be calculated. This value is assigned to the Item property.

CustomSummaryExistEventHandler Delegate

Represents a method that will handle the GridControl.CustomSummaryExists event.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Delegate Sub CustomSummaryExistEventHandler(
   ByVal sender As Object,
   ByVal e As CustomSummaryExistEventArgs
)
```

C#

```
public delegate void CustomSummaryExistEventHandler(
   object sender,
   CustomSummaryExistEventArgs e
)
```

Parameters

The declaration of your event handler must have the same parameters as the **CustomSummaryExistEventHandler** delegate declaration.
sender
The event source.
e
A CustomSummaryExistEventArgs object containing data related to the event.

Remarks

When creating a **CustomSummaryExistEventHandler** delegate, you identify the method that will handle the corresponding event. To associate an event with your event handler, add a delegate instance to this event. The event handler is called whenever the event occurs unless you remove the delegate.

CustomSummaryProcess Enumeration

Specifies the current status of a custom summary calculation.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Enum CustomSummaryProcess
```
C#
```
public enum CustomSummaryProcess
```

Members

Name	Description
Calculate	Indicates that custom summary calculation is in progress. This means the event is raised for a specific data row containing the field value used to calculate the processed custom summary.
Finalize	Indicates that the process of custom summary calculation is finished.
Start	Indicates that the process of custom summary calculation is about to be started.

See Also
DevExpress.Data Namespace

© 2018 Developer Express Inc.

SummaryItemType Enumeration

Lists values specifying the aggregate function types.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Enum SummaryItemType
```
C#
```
public enum SummaryItemType
```

Members

Name	Description
Average	The average value of a column.
Count	The record count.
Custom	Specifies whether calculations should be performed manually using a specially designed event.
Max	The maximum value in a column.
Min	The minimum value in a column.
None	Disables summary value calculation.
Sum	The sum of all values in a column.

Remarks

Values listed in this enumeration are used to specify the aggregate function used to calculate summary values. These values can be assigned to the properties of objects that are representing summary items in a container control.

See Also
DevExpress.Data Namespace
SummaryItemBase.SummaryType

© 2018 Developer Express Inc.

UnboundColumnType Enumeration

Contains values that specify the data type and binding mode of columns.

Namespace: DevExpress.Data
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Enum UnboundColumnType
```
C#
```
public enum UnboundColumnType
```

Members

Name	Description
Boolean	Indicates that the column is unbound and it contains Boolean values (the System.Boolean type).
Bound	Indicates that the column is bound to a field in the control's underlying data source. The type of data this column contains is determined by the bound field.
DateTime	Indicates that the column is unbound and it contains date/time values (the System.DateTime type).
Decimal	Indicates that the column is unbound and it contains decimal values (the System.Decimal type).
Integer	Indicates that the column is unbound and it contains integer values (the System.Int32 type).
Object	Indicates that the column is unbound and it contains values of any type.
String	Indicates that the column is unbound and it contains string values (the System.String type).

Remarks

Grid Control supports bound and unbound columns. Bound columns obtain their data automatically from the control's underlying data source. The data for unbound columns should be provided manually by handling the appropriate event.

Each column in these controls provides a specific property of the **UnboundColumnType** type and this specifies the column's data type and binding mode.

CriteriaOperator Members

Provides the abstract (**MustInherit** in Visual Basic) base class for criteria operators.

The following tables list the members exposed by the CriteriaOperator type.

Public Properties

	Name	Description
	CustomFunctionCount	Returns the number of custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls.

Public Methods

	Name	Description
	Accept	Invokes an appropriate overload of the visitor's Visit method.
	And	Overloaded. Returns the expression which groups the specified operands with logical AND.
	Clone	Overloaded. Creates a copy of the specified DevExpress.Data.Filtering.OperandProperty object.
	CriterionEquals	This method is intended for internal use.
	Equals	Overloaded. Determines whether the current object has the same settings as the specified object.
	Equals	(Inherited from **System.Object**)
	GetCustomFunction	Searches custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls for a function with a specified name.
	GetCustomFunctions	Returns custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls.
	GetHashCode	Gets the hash code (a number) that corresponds to the value of the current CriteriaOperator object.
	GetType	(Inherited from **System.Object**)
	IsNotNull	For internal use only.
	IsNull	For internal use only.
	LegacyToString	Overloaded. Returns the string representation of a specified criteria.
	LegacyToString	Overloaded. Returns the string representation of the criteria specified

© 2018 Developer Express Inc.

		by the current CriteriaOperator instance.
	Not	Returns an instance of the DevExpress.Data.Filtering.UnaryOperator that represents the criterion resulting from the logical inversion of the criterion the current CriteriaOperator represents.
S	Or	Overloaded. Returns the expression which groups two operands with logical OR.
S	Parse	Overloaded. Converts the specified string, specifying an expression, to its CriteriaOperator equivalent.
S	ParseList	Overloaded. Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.
S	ReferenceEquals	(Inherited from **System.Object**)
S	RegisterCustomFunction	Registers a specified custom function to use in any CriteriaOperator-based criteria in your application.
S	RegisterCustomFunctions	Registers specified custom functions to use in any CriteriaOperator-based criteria in your application.
S	ToBasicStyleString	Overloaded. Converts the specified expression into its equivalent string in VB style.
S	ToCStyleString	Overloaded. Converts the specified expression into its equivalent string in C# style.
S	ToString	Overloaded. Converts the specified expression into its equivalent string in VB style.
	ToString	Overloaded. Converts the current expression into its VB equivalent string.
S	TryParse	Tries to convert the specified string representation of an expression to its CriteriaOperator equivalent.
S	UnregisterCustomFunction	Overloaded. Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.

Public Events

	Name	Description
S	UserValueParse	Occurs when restoring a serialized criteria operator that references a user object.

© 2018 Developer Express Inc.

	UserValueToString	Occurs when serializing a criteria operator that references a user object.

	ToString	Overloaded. Converts the current expression into its VB equivalent string.
S	TryParse	Tries to convert the specified string representation of an expression to its CriteriaOperator equivalent.
S	UnregisterCustomFunction	Overloaded. Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.

Public Events

	Name	Description
S	UserValueParse	Occurs when restoring a serialized criteria operator that references a user object.

© 2018 Developer Express Inc.

	UserValueToString	Occurs when serializing a criteria operator that references a user object.

CustomFunctionCount Property

Returns the number of custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public ReadOnly Property CustomFunctionCount As Integer
```

C#

```
public static int CustomFunctionCount { get; }
```

Property Value

An integer value which specifies the number of elements in a collection returned by the GetCustomFunctions function.

UserValueParse Event

Occurs when restoring a serialized criteria operator that references a user object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static event Public UserValueParse As EventHandler(of UserValueProcessingEventArgs)
```

C#

```
public static event EventHandler<UserValueProcessingEventArgs> UserValueParse
```

Event Data

The event handler receives an argument of type DevExpress.Data.Filtering.UserValueProcessingEventArgs containing data related to this event.

Remarks

The UserValueParse and UserValueToString events provide the capability to serialize and deserialize criteria containing arbitrary user objects via the ToString and Parse methods.

When the **ToString** method is called to serialize a criteria operator referencing an object, the **UserValueToString** event is raised. When the resulting string representation needs to be parsed, the **UserValueParse** event is raised. Both the events use the same event arguments class exposing three fields. When handing the **UserValueToString** event, the object **Value** field holds the object reference to serialize. After converting the reference to a string presentation, assign it to the string **Data** field and specify an appropriate tag by specifying the string **Tag** field. The tag should be unique for each particular object kind. When handing the **UserValueParse**, the **Data** and **Tag** field contain previously specified values. Parse them and provide a corresponding object reference by setting the **Value** field. Since the event arguments class is derived from **System.ComponentModel.HandledEventArgs**, set the **Handled** argument to **true** after handling the **UserValueToString** and **UserValueParse** events and specifying other arguments.

The eXpress Persistent Objects (XPO) utilize this functionality to serialize persistent objects to strings. When handling the **UserValueParse** event, XPO assigns the fully qualified type of a persistent object along with its identifier to the **Data** field. "XpoObject" is assigned to the **Tag** field. So, a sample serialized criteria containing a persistent object reference can look like this.

```
[Owner] = ##XpoObject#FeatureCenter.Module.PropertyEditors.CriteriaReferencedObject(54)#
```

To enable this functionality in your XPO application, use the **Session.ParseCriteria** method instead of **CriteriaOperator.Parse** to restore persistent objects serialized into a string. If you already have code that uses the regular **CriteriaOperator.Parse** method, you can wrap the method call with **Session.CreateParseCriteriaSessionScope**.

C#

```
using(mySession.CreateParseCriteriaSessionScope()) {
    //...
    CriteriaOperator.Parse("...");
    //...
}
```

Visual Basic

```
Using mySession.CreateParseCriteriaSessionScope()
    '...
    CriteriaOperator.Parse("...")
    '...
End Using
```

In this instance, the existing **CriteriaOperator.Parse** method will correctly restore persistent objects in the "mySession" session.

The cross-platform data library provides similar functionality for serialization of enumeration types without handling the **UserValueParse**/**UserValueToString** events. For enumerations registered via the static **EnumProcessingHelper.RegisterEnum** method, corresponding criteria values will be serialized in the following way.

```
[EnumProperty] = ##Enum#FeatureCenter.Module.PropertyEditors.TextAndImageEnum,Normal#
```

To enable this functionality in your application, you can register all application enumeration types in the following way.

C#

© 2018 Developer Express Inc.

```
using DevExpress.Data.Filtering;
//...
EnumProcessingHelper.RegisterEnums(AppDomain.CurrentDomain.GetAssemblies());
```

Visual Basic

```
Imports DevExpress.Data.Filtering
'...
EnumProcessingHelper.RegisterEnums(AppDomain.CurrentDomain.GetAssemblies())
```

UserValueToString Event

Occurs when serializing a criteria operator that references a user object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static event Public UserValueToString As EventHandler(of UserValueProcessingEventArgs)
```

C#

```
public static event EventHandler<UserValueProcessingEventArgs> UserValueToString
```

Event Data

The event handler receives an argument of type DevExpress.Data.Filtering.UserValueProcessingEventArgs containing data related to this event.

Remarks

The UserValueParse and UserValueToString events provide the capability to serialize and deserialize criteria containing arbitrary user objects via the ToString and Parse methods.

When the **ToString** method is called to serialize a criteria operator referencing an object, the **UserValueToString** event is raised. When the resulting string representation needs to be parsed, the **UserValueParse** event is raised. Both the events use the same event arguments class exposing three fields. When handing the **UserValueToString** event, the object **Value** field holds the object reference to serialize. After converting the reference to a string presentation, assign it to the string **Data** field and specify an appropriate tag by specifying the string **Tag** field. The tag should be unique for each particular object kind. When handing the **UserValueParse**, the **Data** and **Tag** field contain previously specified values. Parse them and provide a corresponding object reference by setting the **Value** field. Since the event arguments class is derived from **System.ComponentModel.HandledEventArgs**, set the **Handled** argument to **true** after handling the **UserValueToString** and **UserValueParse** events and specifying other arguments.

The eXpress Persistent Objects (XPO) utilize this functionality to serialize persistent objects to strings. When handling the **UserValueParse** event, XPO assigns the fully qualified type of a persistent object along with its identifier to the **Data** field. "XpoObject" is assigned to the **Tag** field. So, a sample serialized criteria containing a persistent object reference can look like this.

```
[Owner] = ##XpoObject#FeatureCenter.Module.PropertyEditors.CriteriaReferencedObject(54)#
```

To enable this functionality in your XPO application, use the **Session.ParseCriteria** method instead of **CriteriaOperator.Parse** to restore persistent objects serialized into a string. If you already have code that uses the regular **CriteriaOperator.Parse** method, you can wrap the method call with **Session.CreateParseCriteriaSessionScope**.

C#

```
using(mySession.CreateParseCriteriaSessionScope()) {
    //...
    CriteriaOperator.Parse("...");
    //...
}
```

Visual Basic

```
Using mySession.CreateParseCriteriaSessionScope()
    '...
    CriteriaOperator.Parse("...")
    '...
End Using
```

In this instance, the existing **CriteriaOperator.Parse** method will correctly restore persistent objects in the "mySession" session.

The cross-platform data library provides similar functionality for serialization of enumeration types without handling the **UserValueParse**/**UserValueToString** events. For enumerations registered via the static **EnumProcessingHelper.RegisterEnum** method, corresponding criteria values will be serialized in the following way.

```
[EnumProperty] = ##Enum#FeatureCenter.Module.PropertyEditors.TextAndImageEnum,Normal#
```

To enable this functionality in your application, you can register all application enumeration types in the following way.

CriteriaOperator Methods

Provides the abstract (**MustInherit** in Visual Basic) base class for criteria operators.

The following tables list the members exposed by the CriteriaOperator type.

Public Methods

	Name	Description
	Accept	Invokes an appropriate overload of the visitor's Visit method.
S	And	Overloaded. Returns the expression which groups the specified operands with logical AND.
S	Clone	Overloaded. Creates a copy of the specified DevExpress.Data.Filtering.OperandProperty object.
S	CriterionEquals	This method is intended for internal use.
	Equals	Overloaded. Determines whether the current object has the same settings as the specified object.
S	Equals	(Inherited from **System.Object**)
S	GetCustomFunction	Searches custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls for a function with a specified name.
S	GetCustomFunctions	Returns custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls.
	GetHashCode	Gets the hash code (a number) that corresponds to the value of the current CriteriaOperator object.
	GetType	(Inherited from **System.Object**)
	IsNotNull	For internal use only.
	IsNull	For internal use only.
S	LegacyToString	Overloaded. Returns the string representation of a specified criteria.
	LegacyToString	Overloaded. Returns the string representation of the criteria specified by the current CriteriaOperator instance.
	Not	Returns an instance of the DevExpress.Data.Filtering.UnaryOperator that represents the criterion resulting from the logical inversion of the criterion the current CriteriaOperator represents.

© 2018 Developer Express Inc.

	Or	Overloaded. Returns the expression which groups two operands with logical OR.
	Parse	Overloaded. Converts the specified string, specifying an expression, to its CriteriaOperator equivalent.
	ParseList	Overloaded. Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.
	ReferenceEquals	(Inherited from **System.Object**)
	RegisterCustomFunction	Registers a specified custom function to use in any CriteriaOperator-based criteria in your application.
	RegisterCustomFunctions	Registers specified custom functions to use in any CriteriaOperator-based criteria in your application.
	ToBasicStyleString	Overloaded. Converts the specified expression into its equivalent string in VB style.
	ToCStyleString	Overloaded. Converts the specified expression into its equivalent string in C# style.
	ToString	Overloaded. Converts the specified expression into its equivalent string in VB style.
	ToString	Overloaded. Converts the current expression into its VB equivalent string.
	TryParse	Tries to convert the specified string representation of an expression to its CriteriaOperator equivalent.
	UnregisterCustomFunction	Overloaded. Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.

Accept Method

Invokes an appropriate overload of the visitor's Visit method.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
abstract Public Function Accept(
   ByVal visitor As ICriteriaVisitor
) As Object
```

C#

```
public abstract object Accept(
   ICriteriaVisitor visitor
)
```

Parameters

visitor
A visitor that implements the DevExpress.Data.Filtering.ICriteriaVisitor interface.

Return Value

An object returned by the specified visitor's Visit method.

Remarks

This method supports the internal infrastructure and is not intended to be used directly from your code.

And Method

Returns the expression which groups the specified operands with logical AND.

Overload List

Name	Description
static CriteriaOperator And(IEnumerable<CriteriaOperator> operands)	Returns the expression which groups the specified operands with logical AND.
static CriteriaOperator And(params CriteriaOperator[] operands)	Returns the expression which groups the specified operands with logical AND.
static CriteriaOperator And(CriteriaOperator left, CriteriaOperator right)	Returns the expression which groups two operands with logical AND.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.And Overload List

Returns the expression which groups the specified operands with logical AND.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function And(
   ByVal operands As IEnumerable(of CriteriaOperator)
) As CriteriaOperator
```
C#
```
public static CriteriaOperator And(
   IEnumerable<CriteriaOperator> operands
)
```

Parameters
operands
A list of operands to be grouped.

Return Value

A CriteriaOperator object representing the expression which groups the specified operands with logical AND.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.And Overload List

Returns the expression which groups the specified operands with logical AND.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function And(
   ByVal operands As CriteriaOperator[]
) As CriteriaOperator
```
C#

© 2018 Developer Express Inc.

```
public static CriteriaOperator And(
   params CriteriaOperator[] operands
)
```

Parameters
operands
An array of CriteriaOperator objects that represent operands.

Return Value

A CriteriaOperator object representing the expression which groups the specified operands with logical AND.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.And Overload List

Returns the expression which groups two operands with logical AND.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic

```
static Public Function And(
   ByVal left As CriteriaOperator,
   ByVal right As CriteriaOperator
) As CriteriaOperator
```

C#

```
public static CriteriaOperator And(
   CriteriaOperator left,
   CriteriaOperator right
)
```

Parameters
left
A CriteriaOperator object which represents the first operand.
right
A CriteriaOperator object which represents the second operand.

Return Value

A CriteriaOperator object representing the expression which groups two operands with logical AND.

Remarks

If one of the specified operands is **null** (**Nothing** in Visual Basic), the **And** method returns another operand. For example, if the first operand is **null** (**Nothing** in Visual Basic), the **And** method returns the second operand.

Clone Method

Creates a copy of the specified DevExpress.Data.Filtering.OperandProperty object.

Overload List

Name	Description
static OperandProperty Clone(OperandProperty origin)	Creates a copy of the specified DevExpress.Data.Filtering.OperandProperty object.
static CriteriaOperator Clone(CriteriaOperator origin)	Creates a copy of the specified CriteriaOperator object.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Clone Overload List

Creates a copy of the specified DevExpress.Data.Filtering.OperandProperty object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function Clone(
   ByVal origin As OperandProperty
) As OperandProperty
```
C#
```
public static OperandProperty Clone(
   OperandProperty origin
)
```

Parameters
origin
An DevExpress.Data.Filtering.OperandProperty object to clone.

Return Value

An DevExpress.Data.Filtering.OperandProperty object which represents an exact copy of the specified object. **null** (**Nothing** in Visual Basic) if the specified object is a null reference.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Clone Overload List

Creates a copy of the specified CriteriaOperator object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function Clone(
   ByVal origin As CriteriaOperator
) As CriteriaOperator
```
C#
```
public static CriteriaOperator Clone(
   CriteriaOperator origin
)
```

Parameters

© 2018 Developer Express Inc.

origin
A CriteriaOperator object to clone.

Return Value

A CriteriaOperator object which represents an exact copy of the specified object. **null** (**Nothing** in Visual Basic) if the specified object is null reference.

CriterionEquals Method

This method is intended for internal use.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function CriterionEquals(
   ByVal left As CriteriaOperator,
   ByVal right As CriteriaOperator
) As Boolean
```
C#
```
public static bool CriterionEquals(
   CriteriaOperator left,
   CriteriaOperator right
)
```

Parameters
left

right

Return Value

CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace

© 2018 Developer Express Inc.

Equals Method

Determines whether the current object has the same settings as the specified object.

Overload List

Name	Description
bool Equals(object obj)	Determines whether the current object has the same settings as the specified object.
static bool Equals(object objA, object objB)	Inherited from **System.Object**

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Equals Overload List

Determines whether the current object has the same settings as the specified object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Overrides Public Function Equals(
   ByVal obj As Object
) As Boolean
```
C#
```
public override bool Equals(
   object obj
)
```

Parameters
obj
An object to compare with the current object.

Return Value

true if the object specified by the parameter has the same settings as the current object; otherwise, **false**.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Equals Overload List

© 2018 Developer Express Inc.

GetCustomFunction Method

Searches custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls for a function with a specified name.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public Function GetCustomFunction(
   ByVal functionName As String
) As ICustomFunctionOperator
```

C#

```
public static ICustomFunctionOperator GetCustomFunction(
   string functionName
)
```

Parameters

functionName
The name of a custom function to search. You specify a custom function's name by implementing the ICustomFunctionOperator.Name property.

Return Value

An ICustomFunctionOperator object that corresponds to the *functionName*, if found; otherwise, **null** (**Nothing** in Visual Basic).

Remarks

This method searches a collection returned by the GetCustomFunctions function for a custom function whose name matches the *functionName*.

See Also

CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace

© 2018 Developer Express Inc.

GetCustomFunctions Method

Returns custom functions registered in an application via the RegisterCustomFunction and RegisterCustomFunctions method calls.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetCustomFunctions() As CustomFunctionCollection
```
C#
```
public static CustomFunctionCollection GetCustomFunctions()
```

Return Value

A CustomFunctionCollection object containing all custom functions registered via the methods mentioned above.

Remarks

To search for a specific custom function by its name, call the GetCustomFunction function.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace

© 2018 Developer Express Inc.

GetHashCode Method

Gets the hash code (a number) that corresponds to the value of the current CriteriaOperator object.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Overrides Public Function GetHashCode() As Integer
```

C#

```
public override int GetHashCode()
```

Return Value

An integer value representing the hash code for the current object.

Remarks

The function supports the .NET infrastructure. For more information on hash codes, see the Object.GetHashCode topic in MSDN.

IsNotNull Method

For internal use only.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Function IsNotNull() As UnaryOperator
```
C#
```
public UnaryOperator IsNotNull()
```

Return Value

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace

© 2018 Developer Express Inc.

IsNull Method

For internal use only.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Function IsNull() As UnaryOperator
```
C#
```
public UnaryOperator IsNull()
```

Return Value

See Also

CriteriaOperator Members
DevExpress.Data.Filtering Namespace

© 2018 Developer Express Inc.

LegacyToString Method

Returns the string representation of the criteria specified by the current CriteriaOperator instance.

Overload List

Name	Description
string LegacyToString()	Returns the string representation of the criteria specified by the current CriteriaOperator instance.
static string LegacyToString(CriteriaOperator criteria)	Returns the string representation of a specified criteria.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.LegacyToString Overload List

Returns the string representation of the criteria specified by the current CriteriaOperator instance.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Function LegacyToString() As String
```
C#
```
public string LegacyToString()
```

Return Value

A string equivalent of the current CriteriaOperator instance.

Remarks

Unlike the ToString method, the **LegacyToString** method removes value suffixes (such as 'm', 'M', 'l', 'L', 'f', 'F', etc.) used to specify types of numeric literals in criteria operands. You can call the **LegacyToString** method to display the returned string in a UI, or save it to an application log. However, this string is actually not in SQL format and cannot be considered as such. If you want to use the string for building SQL queries or for filtering System.Data.DataView, use the approach described in the How to convert the CriteriaOperator to the corresponding filter string in order to use it for building SQL queries or for filtering the DataView Knowledge Base article.

See Also
CriteriaOperator Class
CriteriaOperator Members

CriteriaOperator.LegacyToString Overload List

Returns the string representation of a specified criteria.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function LegacyToString(
   ByVal criteria As CriteriaOperator
) As String
```
C#
```
public static string LegacyToString(
   CriteriaOperator criteria
)
```

Parameters

© 2018 Developer Express Inc.

criteria
A CriteriaOperator instance specifying the criteria used to convert to a string equivalent.

Return Value

A string equivalent of the *criteria*.

Remarks

Unlike the ToString method, the **LegacyToString** method removes value suffixes (such as 'm', 'M', 'l', 'L', 'f', 'F', etc.) used to specify types of numeric literals in criteria operands. You can call the **LegacyToString** method to display the returned string in a UI, or save it to an application log. However, this string is actually not in SQL format and cannot be considered as such. If you want to use the string for building SQL queries or for filtering System.Data.DataView, use the approach described in the How to convert the CriteriaOperator to the corresponding filter string in order to use it for building SQL queries or for filtering the DataView Knowledge Base article.

Not Method

Returns an instance of the DevExpress.Data.Filtering.UnaryOperator that represents the criterion resulting from the logical inversion of the criterion the current CriteriaOperator represents.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Function Not() As UnaryOperator
```
C#
```
public UnaryOperator Not()
```

Return Value

An instance of the DevExpress.Data.Filtering.UnaryOperator that represents the criterion resulting from the logical inversion of the criterion the current CriteriaOperator represents.

Returns the expression which groups the specified operands with logical OR.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function Or(
   ByVal operands As IEnumerable(of CriteriaOperator)
) As CriteriaOperator
```
C#
```
public static CriteriaOperator Or(
   IEnumerable<CriteriaOperator> operands
)
```

Parameters
operands
A list of operands to be grouped.

Return Value

A CriteriaOperator object representing the expression which groups the specified operands with logical OR.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Or Overload List

Returns the expression which groups the specified operands with logical OR.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function Or(
   ByVal operands As CriteriaOperator[]
) As CriteriaOperator
```
C#

© 2018 Developer Express Inc.

```
public static CriteriaOperator Or(
   params CriteriaOperator[] operands
)
```

Parameters
operands
An array of CriteriaOperator objects that represent operands.

Return Value

A CriteriaOperator object representing the expression which groups the specified operands with logical OR.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Or Overload List

Returns the expression which groups two operands with logical OR.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic

```
static Public Function Or(
   ByVal left As CriteriaOperator,
   ByVal right As CriteriaOperator
) As CriteriaOperator
```

C#

```
public static CriteriaOperator Or(
   CriteriaOperator left,
   CriteriaOperator right
)
```

Parameters
left
A CriteriaOperator object which represents the first operand.
right
A CriteriaOperator object which represents the second operand.

Return Value

A CriteriaOperator object representing the expression which groups two operands with logical OR.

Parse Method

Converts the specified string specifying an expression to its CriteriaOperator equivalent.

Overload List

Name	Description
static CriteriaOperator Parse(string stringCriteria, out OperandValue[] criteriaParametersList)	Converts the specified string specifying an expression to its CriteriaOperator equivalent.
static CriteriaOperator Parse(string criteria, params Object[] parameters)	Converts the specified string, specifying an expression, to its CriteriaOperator equivalent.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.Parse Overload List

Converts the specified string specifying an expression to its CriteriaOperator equivalent.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function Parse(
   ByVal stringCriteria As String,
   ByRef criteriaParametersList As OperandValue[]
) As CriteriaOperator
```
C#
```
public static CriteriaOperator Parse(
   string stringCriteria,
   out OperandValue[] criteriaParametersList
)
```

Parameters
stringCriteria
A System.String value that is the expression to convert.
criteriaParametersList
[out] Receives the values that are substituted into the expression in place of question mark characters. These parameters can be omitted.

Return Value

A CriteriaOperator equivalent to the expression contained in *criteria*.

Remarks

This member supports the .NET Framework infrastructure and is not intended to be used directly from your code.

See Also

ParseList Method

Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.

Overload List

Name	Description
static CriteriaOperator[] ParseList(string criteriaList, params Object[] parameters)	Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.
static CriteriaOperator[] ParseList(string criteriaList, out OperandValue[] criteriaParametersList)	Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.ParseList Overload List

Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function ParseList(
   ByVal criteriaList As String,
   ByVal parameters As Object[]
) As CriteriaOperator[]
```
C#
```
public static CriteriaOperator[] ParseList(
   string criteriaList,
   params Object[] parameters
)
```

Parameters
criteriaList
A System.String value that represents the expressions to convert. The expressions are divided by a semicolon.
parameters
The values that are substituted into the expression in place of question mark characters. These parameters can be omitted.

Return Value

An array of CriteriaOperator equivalents to the expressions contained in *criteriaList*.

CriteriaOperator.ParseList Overload List
Parse

Converts the specified string representation of expressions that are divided by a semicolon into their CriteriaOperator equivalents.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

© 2018 Developer Express Inc.

Visual Basic
```
static Public Function ParseList(
   ByVal criteriaList As String,
   ByRef criteriaParametersList As OperandValue[]
) As CriteriaOperator[]
```
C#
```
public static CriteriaOperator[] ParseList(
   string criteriaList,
   out OperandValue[] criteriaParametersList
)
```

Parameters
criteriaList
A System.String value that represents the expressions to convert. The expressions are divided by a semicolon.
criteriaParametersList
Receives the values that are substituted into the expression in place of question mark characters. These parameters can be omitted.

Return Value

An array of CriteriaOperator equivalents to the expressions contained in *criteriaList*.

Remarks

This member supports the .NET Framework infrastructure and is not intended to be used directly from your code.

RegisterCustomFunction Method

Registers a specified custom function to use in any CriteriaOperator-based criteria in your application.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public Sub RegisterCustomFunction(
   ByVal customFunction As ICustomFunctionOperator
)
```

C#

```
public static void RegisterCustomFunction(
   ICustomFunctionOperator customFunction
)
```

Parameters

customFunction
An ICustomFunctionOperator object specifying a custom function to register.

Remarks

To access custom functions registered via the **RegisterCustomFunction** and RegisterCustomFunctions method calls, call the GetCustomFunctions function. To search for a specific registered custom function, call the GetCustomFunction function.

Note
The **RegisterCustomFunction** method throws an exception if the *customFunction* has already been registered.

RegisterCustomFunctions Method

Registers specified custom functions to use in any CriteriaOperator-based criteria in your application.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public Sub RegisterCustomFunctions(
   ByVal customFunctions As IEnumerable(of ICustomFunctionOperator)
)
```

C#

```
public static void RegisterCustomFunctions(
   IEnumerable<ICustomFunctionOperator> customFunctions
)
```

Parameters

customFunctions
A collection of ICustomFunctionOperator objects specifying custom functions to register.

Remarks

To access custom functions registered via the **RegisterCustomFunctions** and RegisterCustomFunction method calls, call the GetCustomFunctions function. To search for a specific registered custom function, call the GetCustomFunction function.

Note
The **RegisterCustomFunctions** method throws an exception if a function contained in the *customFunction* collection has already been registered.

ToBasicStyleString Method

Converts the specified expression into its equivalent string in VB style.

Overload List

Name	Description
static string ToBasicStyleString(CriteriaOperator criteria)	Converts the specified expression into its equivalent string in VB style.
static string ToBasicStyleString(CriteriaOperator criteria, out OperandValue[] criteriaParametersList)	Converts the specified expression into its equivalent string in VB style.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.ToBasicStyleString Overload List

Converts the specified expression into its equivalent string in VB style.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function ToBasicStyleString(
   ByVal criteria As CriteriaOperator
) As String
```
C#
```
public static string ToBasicStyleString(
   CriteriaOperator criteria
)
```

Parameters
criteria
A CriteriaOperator object that represents the expression to convert.

Return Value

A string representation of the specified expression.

Remarks

To convert the string representation of an expression to its CriteriaOperator equivalent, use the Parse method.

Note
The **ToBasicStyleString** method returns a string representation of the criteria which can be displayed in UI or saved in application log. However, this string is actually not SQL and cannot be considered as such.

See Also
CriteriaOperator Class
CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.ToBasicStyleString Overload List
ToCStyleString
Parse

Converts the specified expression into its equivalent string in VB style.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

© 2018 Developer Express Inc.

Syntax

Visual Basic

```
static Public Function ToBasicStyleString(
   ByVal criteria As CriteriaOperator,
   ByRef criteriaParametersList As OperandValue[]
) As String
```

C#

```
public static string ToBasicStyleString(
   CriteriaOperator criteria,
   out OperandValue[] criteriaParametersList
)
```

Parameters

criteria
A CriteriaOperator object that represents the expression to convert.
criteriaParametersList
Receives the values that are marked by a question mark character in the result string.

Return Value

A string representation of the specified expression.

Remarks

This example demonstrate how to use the **ToBasicStyleString** method:

C#

```
OperandValue[] parameters;
CriteriaOperator filterCriteria =
    CriteriaOperator.Parse("[Category] == ? && [Price] < ?", out parameters);
parameters[0].Value = "Saloon";
parameters[1].Value = 100000;
// Returns "[Category] = ? AND [Price] < ?"
string filterString = CriteriaOperator.ToBasicStyleString(filterCriteria, out parameters);
```

Visual Basic

```
Dim parameters As OperandValue()
Dim filterCriteria As CriteriaOperator = _
    CriteriaOperator.Parse("[Category] == ? && [Price] < ?", parameters)
parameters(0).Value = "Saloon"
parameters(1).Value = 100000
' Returns "[Category] = ? AND [Price] < ?"
Dim filterString As String = CriteriaOperator.ToBasicStyleString(filterCriteria, out parameters)
```

To convert the string representation of an expression to its CriteriaOperator equivalent, use the Parse method.

Note

The **ToBasicStyleString** method returns a string representation of the criteria which can be displayed in a UI or saved in application log. However, this string is actually not SQL and cannot be considered as such.

CriteriaOperator.ToCStyleString Overload List

Converts the specified expression into its equivalent string in C# style.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function ToCStyleString(
   ByVal criteria As CriteriaOperator
) As String
```
C#
```
public static string ToCStyleString(
   CriteriaOperator criteria
)
```

Parameters
criteria
A CriteriaOperator object that represents the expression to convert.

Return Value

A string representation of the specified expression.

Remarks

To convert the string representation of an expression into its CriteriaOperator equivalent, use the Parse method.

Note
The **ToCStyleString** method returns a string representation of the criteria which can be displayed in UI or saved in application log. However, this string is actually not SQL and cannot be considered as such.

Parse
ToBasicStyleString

Converts the specified expression into its equivalent string in C# style.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

© 2018 Developer Express Inc.

Syntax

Visual Basic

```
static Public Function ToCStyleString(
   ByVal criteria As CriteriaOperator,
   ByRef criteriaParametersList As OperandValue[]
) As String
```

C#

```
public static string ToCStyleString(
   CriteriaOperator criteria,
   out OperandValue[] criteriaParametersList
)
```

Parameters

criteria
A CriteriaOperator object that represents the expression to convert.
criteriaParametersList
Receives the values that are marked by a question mark character in the result string.

Return Value

A string representation of the specified expression.

Remarks

This example demonstrate how to use the **ToCStyleString** method:

C#

```
OperandValue[] parameters;
CriteriaOperator filterCriteria =
    CriteriaOperator.Parse("[Category] = ? AND [Price] < ?", out parameters);
parameters[0].Value = "Saloon";
parameters[1].Value = 100000;
// Returns "[Category] == ? && [Price] < ?"
string filterString = CriteriaOperator.ToCStyleString(filterCriteria, out parameters);
```

Visual Basic

```
Dim parameters As OperandValue()
Dim filterCriteria As CriteriaOperator = _
    CriteriaOperator.Parse("[Category] = ? AND [Price] < ?", parameters)
parameters(0).Value = "Saloon"
parameters(1).Value = 100000
' Returns "[Category] == ? && [Price] < ?"
Dim filterString As String = CriteriaOperator.ToCStyleString(filterCriteria, out parameters)
```

To convert the string representation of an expression to its CriteriaOperator equivalent, use the Parse method.

Note

The **ToCStyleString** method returns a string representation of the criteria which can be displayed in UI or saved in application log. However, this string is actually not SQL and cannot be considered as such.

ToString Method

Converts the current expression into its VB equivalent string.

Overload List

Name	Description
string ToString()	Converts the current expression into its VB equivalent string.
static string ToString(CriteriaOperator criteria)	Converts the specified expression into its equivalent string in VB style.
static string ToString(CriteriaOperator criteria, out OperandValue[] criteriaParametersList)	Converts the specified expression into its equivalent string in VB style.

CriteriaOperator.ToString Overload List

Converts the current expression into its VB equivalent string.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Overrides Public Function ToString() As String
```
C#
```
public override string ToString()
```

Return Value

A string representation of this expression.

Remarks

To convert the string representation of an expression into its CriteriaOperator equivalent, use the Parse method.

Note	
The **ToString** method returns a string representation of the criteria which can be displayed in UI or saved in application log. However, this string is actually not SQL and cannot be considered as such.

```
static Public Function ToString(
   ByVal criteria As CriteriaOperator
) As String
```

C#

```
public static string ToString(
   CriteriaOperator criteria
)
```

Parameters

criteria
A CriteriaOperator object that represents the expression to convert.

Return Value

A string representation of the specified expression.

Remarks

To convert the string representation of an expression into its CriteriaOperator equivalent, use the Parse method.

Note
The **ToString** method returns a string representation of the criteria which can be displayed in UI or saved in application log. However, this string is actually not SQL and cannot be considered as such .

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public Function ToString(
   ByVal criteria As CriteriaOperator,
   ByRef criteriaParametersList As OperandValue[]
) As String
```

C#

```
public static string ToString(
   CriteriaOperator criteria,
   out OperandValue[] criteriaParametersList
)
```

Parameters

criteria
A CriteriaOperator object that represents the expression to convert.
criteriaParametersList
Receives the values that are marked by question mark character in the result string.

Return Value

A string representation of the specified expression.

Remarks

To convert the string representation of an expression into its CriteriaOperator equivalent, use the Parse method.

Note

TryParse Method

Tries to convert the specified string representation of an expression to its CriteriaOperator equivalent.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
static Public Function TryParse(
   ByVal criteria As String,
   ByVal parameters As Object[]
) As CriteriaOperator
```

C#

```
public static CriteriaOperator TryParse(
   string criteria,
   params Object[] parameters
)
```

Parameters

criteria
A System.String value that represents the expression to convert.
parameters
The values that are substituted into the expression in place of question mark characters. These parameters can be omitted.

Return Value

A CriteriaOperator equivalent to the expression contained in *criteria*.

Remarks

If an exception was raised while trying to convert the specified string, the **TryParse** method returns *null* (*Nothing* in VB).

UnregisterCustomFunction Method

Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.

Overload List

Name	Description
static bool UnregisterCustomFunction(string functionName)	Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.
static bool UnregisterCustomFunction(ICustomFunctionOperator customFunction)	Unregisters a specified custom function from use in any CriteriaOperator-based criteria in your application.

See Also

CriteriaOperator Members
DevExpress.Data.Filtering Namespace
CriteriaOperator.UnregisterCustomFunction Overload List

Unregisters a custom function with a specified name from use in any CriteriaOperator-based criteria in your application.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
static Public Function UnregisterCustomFunction(
   ByVal functionName As String
) As Boolean
```
C#
```
public static bool UnregisterCustomFunction(
   string functionName
)
```

Parameters
functionName
The name of a custom function to unregister.

Return Value

true if a custom function whose name matches the *functionName* has successfully been removed from a collection returned by the GetCustomFunctions function; otherwise, **false**.

Remarks

To remove a custom function instance, call the other UnregisterCustomFunction overloaded method and pass the instance as its parameter.

RegisterCustomFunction
RegisterCustomFunctions

Unregisters a specified custom function from use in any CriteriaOperator-based criteria in your application.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

© 2018 Developer Express Inc.

Visual Basic
```
static Public Function UnregisterCustomFunction(
   ByVal customFunction As ICustomFunctionOperator
) As Boolean
```
C#
```
public static bool UnregisterCustomFunction(
   ICustomFunctionOperator customFunction
)
```

Parameters
customFunction
An ICustomFunctionOperator object instance specifying a custom function to unregister.

Return Value

true if the *customFunction* has successfully been removed from a collection returned by the GetCustomFunctions function; otherwise, **false**.

Remarks

To remove a custom function with a specific name, call the other UnregisterCustomFunction overloaded method and pass the name as its parameter.

ICustomFunctionOperator Interface

Declares the base functionality for custom functions.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Interface ICustomFunctionOperator
```
C#
```
public interface ICustomFunctionOperator
```

Remarks

The **ICustomFunctionOperator** interface declares only the essential members allowing you to identify a custom function and evaluate its values on the client. To add advanced capabilities to your custom functions, the DevExpress.Data.Filtering.ICustomFunctionOperatorBrowsable and DevExpress.Data.Filtering.ICustomFunctionOperatorFormattable interfaces need to be implemented as well.

Inheritance Hierarchy

Name Property

When implemented by a custom function, specifies its name.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
ReadOnly Property Name As String
```

C#

```
string Name { get; }
```

Property Value

A String used to identify a custom function.

Evaluate Method

When implemented by a custom function, evaluates it on the client.

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Function Evaluate(
   ByVal operands As Object[]
) As Object
```

C#

```
object Evaluate(
   params Object[] operands
)
```

Parameters

operands
An array of objects specifying function operands (parameters).

Return Value

An Object specifying a custom function's return value, calculated based on the *operands*.

See Also

ResultType Method

When implemented by a custom function, determines its return value type based on the type of function operands (parameters).

Namespace: DevExpress.Data.Filtering
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Function ResultType(
   ByVal operands As Type[]
) As Type
```
C#
```
Type ResultType(
   params Type[] operands
)
```

Parameters
operands
An array of function operator (parameter) types.

Return Value

A Type object specifying the return value type of a custom function.

GetPropertyName<T> Method

Returns the name of a property identified by a lambda expression.

Namespace: DevExpress.Mvvm
Assembly: DevExpress.Mvvm.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetPropertyName(of T)(
   ByVal expression As Expression(of Func(of T))
) As String
```
C#
```
public static string GetPropertyName<T>(
   Expression<Func<T>> expression
)
```

Parameters
expression
A lambda expression selecting the property.

Return Value

The name of the property accessed by expression.

DevExpress.Mvvm.UI

Contains MVVM-aware UI controls.

Classes

	Class	Description
	SplashScreenService	Allows you to display splash screens.

© 2018 Developer Express Inc.

SplashScreenService Class

Allows you to display splash screens.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Class SplashScreenService Inherits ViewServiceBase, ISplashScreenService
```

C#

```
public class SplashScreenService : ViewServiceBase, ISplashScreenService
```

Remarks

You can use splash screens to provide an end-user with information about the progress of certain processes in your application.

To add a splash screen to the application, define the **SplashScreenService** in the **Interaction.Behaviors** collection.

Xaml

```
xmlns:dxmvvmui="using:DevExpress.Mvvm.UI"
xmlns:dxmvvmi="using:DevExpress.Mvvm.UI.Interactivity"
<dxmvvmi:Interaction.Behaviors>
    <dxmvvmui:SplashScreenService />
</dxmvvmi:Interaction.Behaviors>
```

Then, access the attached **SplashScreenService** in your ViewModel by using the **ViewModelBase.GetService** method and invoke the ISplashScreenService.ShowSplashScreen method to show the splash screen.

C#

```
public class MainViewModel : ViewModelBase {
    public ICommand ShowSplashScreenCommand { get; private set; }
    public ISplashScreenService DefaultSplashScreenService {
        get {
            return this.GetService<ISplashScreenService>();
        }
    }
    public MainViewModel() {
        ShowSplashScreenCommand = new DelegateCommand(OnShowSplashScreenCommandExecute);
    }
    private async void OnShowSplashScreenCommandExecute() {
        DefaultSplashScreenService.ShowSplashScreen();
        await Task.Delay(4000);
        DefaultSplashScreenService.HideSplashScreen();
    }
}
```

Visual Basic

Use the SplashScreenType property to specify the type of view containing a splash screen that needs to be shown.

Important

SplashScreenService works only when the DXFrame or HamburgerMenuFrame is used.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T418944.

C#

```
 (MainPage.xaml.cs)
using Windows.UI.Xaml.Controls;
namespace App1 {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
        }
    }
}
```

C#

SplashScreenService Members

Allows you to display splash screens.

The following tables list the members exposed by the SplashScreenService type.

Public Constructors

	Name	Description
	SplashScreenService	Initializes a new instance of the SplashScreenService class with default settings.

Public Properties

	Name	Description
	CancelCommand	Gets or sets a command executed when the **Back** button is clicked. This is a dependency property.
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	IsAttached	(Inherited from **DevExpress.Mvvm.UI.Interactivity.AttachableObjectBase**)
	MaxProgress	Gets or sets the maximum progress value. This is a dependency property.
	Name	(Inherited from **DevExpress.Mvvm.UI.ServiceBase Generic<T>**)
	Progress	Gets or sets the current progress value. This is a dependency property.
	SplashScreenType	Gets or sets the type of splash screen to be shown. This is a dependency property.
	State	Gets or sets a data object to be passed to the splash screen service. This is a dependency property.
	ViewLocator	(Inherited from **DevExpress.Mvvm.UI.ViewServiceBase**)
	ViewTemplate	(Inherited from **DevExpress.Mvvm.UI.ViewServiceBase**)
	ViewTemplateSelector	Gets or sets an object that chooses the view template based on custom logic.
	YieldToParent	(Inherited from **DevExpress.Mvvm.UI.ServiceBase Generic<T>**)

CancelCommand Property

Gets or sets a command executed when the **Back** button is clicked. This is a dependency property.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Property CancelCommand As ICommand
```

C#

```
public ICommand CancelCommand { get; set; }
```

Property Value

A **ICommand** object executed when the **Back** button is clicked.

MaxProgress Property

Gets or sets the maximum progress value. This is a dependency property.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax

Visual Basic

```
Public Property MaxProgress As Double
```

C#

```
public Double MaxProgress { get; set; }
```

Property Value

A **System.Double** object specifying the maximum progress value.

SplashScreenType Property

Gets or sets the type of splash screen to be shown. This is a dependency property.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Property SplashScreenType As Type
```
C#
```
public Type SplashScreenType { get; set; }
```

Property Value

An object specifying the type of splash screen to be shown.

State Property

Gets or sets a data object to be passed to the splash screen service. This is a dependency property.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Property State As Object
```
C#
```
public object State { get; set; }
```

Property Value

An object specifying data to be passed to the splash screen service.

ViewTemplateSelector Property

Gets or sets an object that chooses the view template based on custom logic.

Namespace: DevExpress.Mvvm.UI
Assembly: DevExpress.Core.v18.1.dll

Syntax
Visual Basic
```
Public Property ViewTemplateSelector As DataTemplateSelector
```
C#
```
public DataTemplateSelector ViewTemplateSelector { get; set; }
```

Property Value

A **Windows.UI.Xaml.Controls.DataTemplateSelector** descendant that chooses a template based on custom logic.

DevExpress.UI.Xaml

Contains basic classes for all DevExpress Windows 10 App Controls.

Classes

	Class	Description
	ContextMenu	Represents a flyout menu that can be attached to any visual element.
	StrokeStyle	Contains parameters of the style used to draw a stroke line.
	SvgIcon	Allows you to display SVG images in your applications.

Enumerations

	Enumeration	Description
	IconSizeUnit	Lists measurement units used for icons.

ContextMenu Class

Represents a flyout menu that can be attached to any visual element.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Class ContextMenu Inherits DependencyObject, ISupportContextMenu,
  IContextMenuBase,
  ISupportContextMenuEvents
```

C#

```
public class ContextMenu : DependencyObject, ISupportContextMenu,
  IContextMenuBase,
  ISupportContextMenuEvents
```

ContextMenu Members

Represents a flyout menu that can be attached to any visual element.

The following tables list the members exposed by the ContextMenu type.

Public Constructors

	Name	Description
	ContextMenu	Overloaded. Initializes a new instance of the ContextMenu class with the specified settings.

Public Properties

	Name	Description
	Content	Gets or sets the UI element that represents the context menu. This is a dependency property.
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	FlyoutPlacementBehavior	Gets or sets whether the menu is aligned relative to its target or the cursor. This is an attached property. This is a dependency property.
	FlyoutSettings	Gets or sets the flyout settings applied to the menu. This is a dependency property.
	Header	Gets or sets the menu header. This is a dependency property.
	IsOpen	Gets whether the menu is currently opened.
	Menu	Gets or sets the Context Menu assigned to the visual element. This is an attached property. This is a dependency property.
	RequestedTheme	Gets or sets the theme that should be used for the menu content specified by the Content property.

Public Methods

	Name	Description
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Close	Closes the context menu.
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)

© 2018 Developer Express Inc.

	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
S	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	GetFlyoutPlacementBehavior	Gets the value of the FlyoutPlacementBehavior attached property for a specified flyout element.
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
S	GetMenu	Gets the value of the Menu attached property for a specified DependencyObject.
	GetType	(Inherited from **System.Object**)
	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	Open	Overloaded. Opens the context menu.
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	SetFlyoutPlacementBehavior	Sets the value of the FlyoutPlacementBehavior attached property to a specified flyout element.
S	SetMenu	Sets the value of the Menu attached property to a specified DependencyObject.
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Public Fields

ContextMenu Constructor (FrameworkElement)

Initializes a new instance of the ContextMenu class with the specified settings.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
Public New(
   ByVal target As FrameworkElement
)
```
C#
```
public ContextMenu(
   FrameworkElement target
)
```

Parameters
target
A FrameworkElement object that represents the target element to which the menu is assigned.

S	SetMenu	Sets the value of the Menu attached property to a specified DependencyObject.
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Public Fields

© 2018 Developer Express Inc.

	Name	Description
	ContentProperty	Identifies the Content dependency property.
	FlyoutPlacementBehaviorProperty	Identifies the FlyoutPlacementBehavior dependency property.
	FlyoutSettingsProperty	Identifies the FlyoutSettings dependency property.
	HeaderProperty	Identifies the Header dependency property.
	MenuProperty	Identifies the Menu dependency property.
	RequestedThemeProperty	Identifies the RequestedTheme dependency property.

Public Events

	Name	Description
	Closed	Fires after the context menu has been closed.
	Opened	Fires after the context menu has been opened.
	Opening	Fires when the context menu is about to be invoked.

Content Property

Gets or sets the UI element that represents the context menu. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property Content As Object
```

C#

```
public object Content { get; set; }
```

Property Value

A Windows.UI.Xaml.UIElement descendant or Windows.UI.Xaml.DataTemplate instance.

See Also

FlyoutPlacementBehavior Attached Property

Gets or sets whether the menu is aligned relative to its target or the cursor. This is an attached property. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
See GetFlyoutPlacementBehavior, SetFlyoutPlacementBehavior
```
C#
```
See GetFlyoutPlacementBehavior, SetFlyoutPlacementBehavior
```

Property Value

A DevExpress.UI.Xaml.FlyoutPalcementBehavior enumeration value.

FlyoutSettings Property

Gets or sets the flyout settings applied to the menu. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property FlyoutSettings As FlyoutSettingsBase
```

C#

```
public FlyoutSettingsBase FlyoutSettings { get; set; }
```

Property Value

A DevExpress.UI.Xaml.FlyoutSettingsBase class instance, providing access to the flyout settings.

Header Property

Gets or sets the menu header. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property Header As String
```

C#

```
public string Header { get; set; }
```

Property Value

A string value that represents the menu header.

Remarks

See Also

IsOpen Property

Gets whether the menu is currently opened.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property IsOpen As Boolean
```

C#

```
public bool IsOpen { get; }
```

Property Value

true if the menu is opened; otherwise, **false**.

Menu Attached Property

Gets or sets the Context Menu assigned to the visual element. This is an attached property. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
See GetMenu, SetMenu
```
C#
```
See GetMenu, SetMenu
```

Property Value

A ContextMenu instance representing the flyout menu.

See Also

RequestedTheme Property

Gets or sets the theme that should be used for the menu content specified by the Content property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property RequestedTheme As ElementTheme
```

C#

```
public ElementTheme RequestedTheme { get; set; }
```

Property Value

A Windows.UI.Xaml.ElementTheme enumeration value.

Closed Event

Fires after the context menu has been closed.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
event Public Closed As EventHandler
```
C#
```
public event EventHandler Closed
```

Event Data

The event handler receives an argument of type System.EventArgs containing data related to this event.

See Also
ContextMenu Class
ContextMenu Members
DevExpress.UI.Xaml Namespace

Opened Event

Fires after the context menu has been opened.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
event Public Opened As EventHandler
```
C#
```
public event EventHandler Opened
```

Event Data

The event handler receives an argument of type System.EventArgs containing data related to this event.

See Also

Opening Event

Fires when the context menu is about to be invoked.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
event Public Opening As EventHandler(of ContextMenuOpeningEventArgs)
```

C#

```
public event EventHandler<ContextMenuOpeningEventArgs> Opening
```

Event Data

The event handler receives an argument of type DevExpress.UI.Xaml.ContextMenuOpeningEventArgs containing data related to this event.

Remarks

You can handle this event to customize the menu context or prevent it from being invoked. To cancel invoking the menu, set the event's **Cancel** parameter to **true**.

ContextMenu Methods

Represents a flyout menu that can be attached to any visual element.

The following tables list the members exposed by the ContextMenu type.

Public Methods

	Name	Description
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Close	Closes the context menu.
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)
	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
S	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	GetFlyoutPlacementBehavior	Gets the value of the FlyoutPlacementBehavior attached property for a specified flyout element.
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
S	GetMenu	Gets the value of the Menu attached property for a specified DependencyObject.
	GetType	(Inherited from **System.Object**)
	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	Open	Overloaded. Opens the context menu.
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	SetFlyoutPlacementBehavior	Sets the value of the FlyoutPlacementBehavior attached

GetFlyoutPlacementBehavior Method

Gets the value of the FlyoutPlacementBehavior attached property for a specified flyout element.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetFlyoutPlacementBehavior(
   ByVal d As FlyoutBase
) As FlyoutPlacementBehavior
```
C#
```
public static FlyoutPlacementBehavior GetFlyoutPlacementBehavior(
   FlyoutBase d
)
```

Parameters
d
The element from which the property value is read.

Return Value

The FlyoutPlacementBehavior property value for the element.

GetMenu Method

Gets the value of the Menu attached property for a specified DependencyObject.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetMenu(
   ByVal d As DependencyObject
) As ContextMenu
```
C#
```
public static ContextMenu GetMenu(
   DependencyObject d
)
```

Parameters
d
The element from which the property value is read.

Return Value

The Menu property value for the element.

)
```
C#
```
public void Open(
   object menuContent,
   object dataContext,
   UIElement placementTarget,
   Point targetPosition,
   string header,
   FlyoutSettingsBase settings
)
```

Parameters
menuContent
A Windows.UI.Xaml.UIElement descendant or Windows.UI.Xaml.DataTemplate instance that represents the menu content.
dataContext
The data context for the menu.
placementTarget
A Windows.UI.Xaml.UIElement descendant to which the menu is attached.
targetPosition
A Windows.Foundation.Point object that represents the point relative to which the context menu should be displayed.
header
A string value that is the menu header.

SetFlyoutPlacementBehavior Method

Sets the value of the FlyoutPlacementBehavior attached property to a specified flyout element.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
static Public Sub SetFlyoutPlacementBehavior(
   ByVal d As FlyoutBase,
   ByVal behavior As FlyoutPlacementBehavior
)
```
C#
```
public static void SetFlyoutPlacementBehavior(
   FlyoutBase d,
   FlyoutPlacementBehavior behavior
)
```

Parameters
d
The flyout element on which to set the attached property.
behavior
The property value to set.

SetMenu Method

Sets the value of the Menu attached property to a specified DependencyObject.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
static Public Sub SetMenu(
   ByVal d As DependencyObject,
   ByVal menu As ContextMenu
)
```
C#
```
public static void SetMenu(
   DependencyObject d,
   ContextMenu menu
)
```

Parameters
d
The element to which the attached property is written.
menu
The required ContextMenu value.

IconSizeUnit Enumeration

Lists measurement units used for icons.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
Public Enum IconSizeUnit
```
C#
```
public enum IconSizeUnit
```

Members

Name	Description
pt	Specifies points as measurement units.
px	Specifies pixels as measurement units.

Remarks

Values listed by this enumeration are used to set the HamburgerMenuIconButton.IconSizeUnit property value.

StrokeStyle Members

Contains parameters of the style used to draw a stroke line.

The following tables list the members exposed by the StrokeStyle type.

Public Constructors

	Name	Description
	StrokeStyle	Initializes a new instance of the StrokeStyle class with default settings.

Public Properties

	Name	Description
	DashArray	Gets or sets a list of comma or white space separated lengths and percentages that specify the lengths of alternating dashes and gaps.
	DashCap	Gets or sets a value that specifies how the ends of a dash are drawn.
	DashOffset	Gets or sets the distance from the line start to the beginning of a dash pattern.
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	EndLineCap	Gets or sets the type of shape that is used at the end of a stroke.
	LineJoin	Gets or sets the join style for the ends of two consecutive lines drawn with this stroke line.
	MiterLimit	Gets or sets the limit of the ratio of the miter length to half this stroke line's thickness.
	NativeStrokeStyle	Provides access to the native stroke style.
	StartLineCap	Gets or sets the type of shape that is used at the beginning of a stroke.
	Thickness	Gets or sets the thickness of the stroke line that is painted on a map.
	ThicknessScale	Specifies the thickness scale.

Public Methods

	Name	Description
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)

© 2018 Developer Express Inc.

DashArray Property

Gets or sets a list of comma or white space separated lengths and percentages that specify the lengths of alternating dashes and gaps.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax
Visual Basic
```
Public Property DashArray As DoubleCollection
```
C#
```
public DoubleCollection DashArray { get; set; }
```

Property Value

An ordered collection of System.Double values that represent the dash array.

DashCap Property

Gets or sets a value that specifies how the ends of a dash are drawn.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax
Visual Basic
```
Public Property DashCap As PenLineCap
```
C#
```
public PenLineCap DashCap { get; set; }
```

Property Value

A PenLineCap object.

DashOffset Property

Gets or sets the distance from the line start to the beginning of a dash pattern.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax

Visual Basic

```
Public Property DashOffset As Double
```

C#

```
public Double DashOffset { get; set; }
```

Property Value

A double value that specifies the dash offset.

EndLineCap Property

Gets or sets the type of shape that is used at the end of a stroke.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax

Visual Basic

```
Public Property EndLineCap As PenLineCap
```

C#

```
public PenLineCap EndLineCap { get; set; }
```

Property Value

A **System.Windows.Media.PenLineCap** object that ends the map stroke.

See Also

LineJoin Property

Gets or sets the join style for the ends of two consecutive lines drawn with this stroke line.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax

Visual Basic

```
Public Property LineJoin As PenLineJoin
```

C#

```
public PenLineJoin LineJoin { get; set; }
```

Property Value

A **System.Windows.Media.PenLineJoin** enumeration object that describes the shape that joins two lines.

MiterLimit Property

Gets or sets the limit of the ratio of the miter length to half this stroke line's thickness.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax

Visual Basic

```
Public Property MiterLimit As Double
```

C#

```
public Double MiterLimit { get; set; }
```

Property Value

A double value that specifies the miter limit.

NativeStrokeStyle Property

Provides access to the native stroke style.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax
Visual Basic
```
Public Property NativeStrokeStyle As IStrokeStyle
```
C#
```
public IStrokeStyle NativeStrokeStyle { get; set; }
```

Property Value

A IStrokeStyle object.

StartLineCap Property

Gets or sets the type of shape that is used at the beginning of a stroke.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.Drawing.v18.1.dll

Syntax

Visual Basic

```
Public Property StartLineCap As PenLineCap
```

C#

```
public PenLineCap StartLineCap { get; set; }
```

Property Value

A **System.Windows.Media.PenLineCap** object that starts the map stroke.

```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event.

The following **PropertyChangedEventArgs** properties provide information specific to this event.

SvgIcon Class

Allows you to display SVG images in your applications.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Class SvgIcon Inherits BitmapIcon, ISvgColorizer
```

C#

```
public class SvgIcon : BitmapIcon, ISvgColorizer
```

Remarks

To learn more, see SVG Icon.

SvgIcon Constructor (SvgImage, Size)

Initializes a new instance of the SvgIcon class.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
Public New(
   ByVal defaultImage As SvgImage,
   ByVal defaultSize As Size
)
```
C#
```
public SvgIcon(
   SvgImage defaultImage,
   Size defaultSize
)
```

Parameters
defaultImage
The SVG image.
defaultSize
The default size of the image.

AutoSize Property

Gets or sets whether the size of the source SVG image is automatically adjusted to the container dimensions. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property AutoSize As Boolean
```

C#

```
public bool AutoSize { get; set; }
```

Property Value

true to automatically adjust the size of the image; otherwise, **false**. By default, **true**.

Remarks

If the **AutoSize** property is set to **false**, the values of the **Width** and **Height** properties are used to set the size of the image. If these properties are not set, the values of the **height** and **width** properties defined in the SVG source file are used instead.

Note
If the **AutoSize** property is set to **false** and the IconStretch property is set to a value other than **None**, the resulting image may appear distorted (e.g., pixelated) due to improper scaling. To prevent it, specify the values of the **Width** and **Height** properties.

HorizontalContentAlignment Property

Gets or sets the horizontal alignment of the icon. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property HorizontalContentAlignment As HorizontalAlignment
```

C#

```
public HorizontalAlignment HorizontalContentAlignment { get; set; }
```

Property Value

A Windows.UI.Xaml.HorizontalAlignment enumeration value.

IconStretch Property

Gets or sets a value that specifies how the image is resized to fill its allocated space. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property IconStretch As Stretch
```

C#

```
public Stretch IconStretch { get; set; }
```

Property Value

A Windows.UI.Xaml.Media.Stretch enumeration value.

IsLoaded Property

Gets whether the SVG image has been loaded.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property IsLoaded As Boolean
```

C#

```
public bool IsLoaded { get; }
```

Property Value

true, if the SVG image has been loaded; otherwise, **false**.

IsLoading Property

Gets whether the SVG image is currently loading.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property IsLoading As Boolean
```

C#

```
public bool IsLoading { get; }
```

Property Value

true, if the SVG image is currently loading; otherwise, **false**.

Source Property

Gets or sets the uniform resource identifier of the SVG image. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax
Visual Basic
```
Public Property Source As Uri
```
C#
```
public Uri Source { get; set; }
```

Property Value

A System.Uri object that specifies the uniform resource identifier of the SVG image.

VerticalContentAlignment Property

Gets or sets the vertical alignment of the icon. This is a dependency property.

Namespace: DevExpress.UI.Xaml
Assembly: DevExpress.UI.Xaml.v18.1.dll

Syntax

Visual Basic

```
Public Property VerticalContentAlignment As VerticalAlignment
```

C#

```
public VerticalAlignment VerticalContentAlignment { get; set; }
```

Property Value

A Windows.UI.Xaml.VerticalAlignment enumeration value.

DevExpress.UI.Xaml.Charts

Contains classes which implement the main functionality of Chart Controls.

Classes

	Class	Description
	AreaSeriesView	Represents a series view of the Area type.
	AxisBase	The base class for classes that provide axes functionality for a chart control.
	AxisLabelOptions	Contains options that define appearance and behavior of axis labels.
	AxisRangeBase	The base class for all axis ranges.
	AxisTitle	Defines the common settings of an axis title.
	AxisX	Represents the X-Axis for 2D charts.
	AxisY	Represents the Y-Axis for 2D charts.
	BarSeriesView	Represents the base class for all Bar and Column series views.
	CartesianChart	The Cartesian Chart control to plot series of data points on an XY Cartesian diagram.
	CartesianSeriesView	Represents the base class for all series views that can be displayed on a CartesianChart control.
	ChartBase	The base class for chart controls.
	ChartDataAdapter	The base class for all adapters that provide data for a series.
	ChartDependencyObject	Enables WinRT property system services for its derived model classes.
	ChartElement	Represents the base class for other chart elements intended to hide most properties of the Windows.UI.Xaml.Controls.Control class.
	CollectionBase<T>	A base for certain collections used in charts.
	ContourAppearance	Contains settings that specify the appearance of a contour drawn around chart elements.
	DataMember	Contains data member settings that specify from which column in a datasource to obtain data for data points, as well as how to treat this data.
	DataMemberCollection	Represents a collection that stores the data members of a particular DataSourceAdapter.
	DataPoint	An individual data point in the series.
	DataPointCollection	Provides a collection of data points for a series.
	DataPoints	A collection of DataPoint objects.

© 2018 Developer Express Inc.

	DataSourceAdapter	Contains data binding settings that define the datasource to obtain data for a series, as well as dat
	DonutSeriesView	Represents a series view of the Donut type.
	FullStackedAreaSeriesView	Represents a series view of the Full-Stacked Area type.
	FullStackedBarSeriesView	Represents a series view of the Full-Stacked Bar type.
	FullStackedLineSeriesView	Represents a series view of the Full-Stacked Line type.
	FunnelChart	The Funnel Chart control is used to plot series of data points on a funnel chart area.
	FunnelSeriesView	Represents a series view of the Funnel type.
	Legend	Represents a chart control's legend.
	LineSeriesView	Represents a series view of the Line type.
	MarkerSeriesView	Represents the base class for all series views that contain data point markers.
	NestedDonutSeriesView	Represents a series view of the Nested Donut type.
	Palette	Represents a palette (collection of colors) used to draw a chart.
	PieChart	The Pie Chart control to plot series of data points on a pie chart area.
	PieSeriesView	Represents a series view of the Pie type.
	PointSeriesView	Represents a series view of the Point type.
	ScatterLineSeriesView	Represents a series view of the Scatter Line type.
	Series	Represents an individual series within a chart control.
	SeriesCollection	Represents a collection that stores individual series within a chart control.
	SeriesLabelOptions	Contains options that define the appearance and behavior of data point labels.
	SeriesTitle	Contains settings that define the appearance and behavior of a series title.
	SeriesView	Represents the base class for all series views.
	SideBySideBarSeriesView	Represents a series view of the Side-by-Side Bar type.
	SideBySideFullStackedBarSeriesView	Represents a series view of the Side-by-Side Full-Stacked Bar type.
	SideBySideStackedBarSeriesView	Represents a series view of the Side-by-Side Stacked Bar type.

© 2018 Developer Express Inc.

	StackedAreaSeriesView	Represents a series view of the Stacked Area type.
	StackedBarSeriesView	Represents a series view of the Stacked Bar type.
	StackedLineSeriesView	Represents a series view of the Stacked Line type.
	StepAreaSeriesView	Represents a series view of the Step Area type.
	StepLineSeriesView	Represents a series view of the Step Line type.
	Strip	Represents a strip within a chart control's diagram.
	StripCollection	Represents a collection that stores the strips of a particular axis.
	VisualAxisRange	Defines the leftmost and rightmost values that are currently visible on an axis.
	WholeAxisRange	Defines the minimum and possible values that can be displayed on an axis.

Enumerations

	Enumeration	Description
	ActualScaleType	Contains the values used to identify the actual scale type for the argument and value data of data points.
	AxisAlignment	Lists the values used to specify an axis alignment.
	BarLabelPosition	Lists the values used to specify the position of Bar labels.
	ChartDataMemberType	Lists the values used to specify which attribute of a data point should be populated using a data member's settings.
	DataChangingAnimationMode	Lists the values used to specify how data points are animated when the underlying data is changed.
	DateTimeMeasureUnit	Lists the values that specify the unit of measurement for date-time values within a chart control.
	FunnelLabelPosition	Lists the values used to specify the position of funnel labels.
	HorizontalPosition	Lists the values that specify the legend's horizontal alignment within the chart.
	PieLabelPosition	Lists the values used to specify the position of pie labels.
	PieSweepDirection	Lists the values that are used to define the direction of a 2D Pie series sweep.
	RangeControlViewType	Lists the values used to specify how a series should be represented in a Range Control.

© 2018 Developer Express Inc.

	ScaleType	Contains the values used to specify the scale type for the argument and value data of data points.
	SeriesTitlePosition	Lists the values used to specify the position of series titles.
	TitleAlignment	Lists the values used to specify the alignment of an axis title relative to its owner axis.
	UnwindDirection	Lists the values that are used to define the direction of an unwinding animation.
	VerticalPosition	Lists the values that specify the legend's vertical alignment within the chart.

© 2018 Developer Express Inc.

ActualScaleType Enumeration

Contains the values used to identify the actual scale type for the argument and value data of data points.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum ActualScaleType
```
C#
```
public enum ActualScaleType
```

Members

Name	Description
DateTime	Identifies the **DateTime** data scale. This means that data provided for the DataPointCollection.Points will be treated as **DateTime** values, and will be shown on the axis as **DateTime** values (e.g., **January, 2003**, **January, 2004**, and **January, 2005**).
Numerical	Identifies the **Numerical** data scale. This means that data provided for the DataPointCollection.Points will be treated as numerical values, and will be shown on the axis as numbers (e.g., **100**, **200**, and **300**).
Qualitative	Identifies the **Qualitative** data scale. This means that data provided for the DataPointCollection.Points will be treated as qualitative values, and will be shown on the axis as textual representations (e.g., **A**, **B**, and **C**).

Remarks

The values listed by the **ActualScaleType** enumerator are used to set the DataPointCollection.ActualArgumentScaleType and DataPointCollection.ActualValueScaleType properties.

AreaSeriesView Class

Represents a series view of the Area type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AreaSeriesView Inherits MarkerSeriesView
```

C#

```
public class AreaSeriesView : MarkerSeriesView
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the area type, refer to the Area document.

AreaSeriesView Members

Represents a series view of the Area type.

The following tables list the members exposed by the AreaSeriesView type.

Public Constructors

	Name	Description
	AreaSeriesView	Initializes a new instance of the AreaSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ContourAppearance	Gets or sets the appearance of an area contour.

© 2018 Developer Express Inc.

	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)

Public Fields

	Name	Description
S	AngleProperty	Identifies the Angle dependency property. (Inherited from **MarkerSeriesView**)
S	AntialiasingProperty	Identifies the Antialiasing dependency property. (Inherited from **SeriesView**)
S	BrushProperty	Identifies the Brush dependency property. (Inherited from **CartesianSeriesView**)
S	ColorEachProperty	Identifies the ColorEach dependency property. (Inherited from **CartesianSeriesView**)
S	ContourAppearanceProperty	Identifies the ContourAppearance dependency property.
S	DataChangingAnimationModeProperty	Identifies the DataChangingAnimationMode dependency property. (Inherited from **SeriesView**)
S	LabelOptionsProperty	Identifies the LabelOptions dependency property. (Inherited from **SeriesView**)
S	LegendMarkerTemplateProperty	Identifies the LegendMarkerTemplate dependency property. (Inherited from **SeriesView**)
S	LegendPatternProperty	Identifies the LegendPattern dependency property. (Inherited from **SeriesView**)
S	LegendPointPatternProperty	Identifies the LegendPointPattern dependency property. (Inherited from **SeriesView**)
S	MarkerSizeProperty	Identifies the MarkerSize dependency property.
S	PaletteProperty	Identifies the Palette dependency property. (Inherited from **SeriesView**)

© 2018 Developer Express Inc.

	PointAnimationProperty	Identifies the PointAnimation dependency property. (Inherited from **MarkerSeriesView**)
	RangeControlViewTypeProperty	Identifies the RangeControlViewType dependency property.
	SelectedItemBrushProperty	Identifies the SelectedItemBrush dependency property. (Inherited from **SeriesView**)
	SelectedItemProperty	Identifies the SelectedItem dependency property. (Inherited from **SeriesView**)
	SelectedItemsProperty	Identifies the SelectedItems dependency property. (Inherited from **SeriesView**)
	SeriesAnimationProperty	Identifies the SeriesAnimation dependency property.
	ShowContourProperty	Identifies the ShowContour dependency property.
	ShowLabelsProperty	Identifies the ShowLabels dependency property. (Inherited from **SeriesView**)
	ShowMarkersProperty	Identifies the ShowMarkers dependency property.
	ShowToolTipOnSelectItemProperty	Identifies the ShowToolTipOnSelectItem dependency property. (Inherited from **SeriesView**)
	ToolTipPointPatternProperty	Identifies the ToolTipPointPattern dependency property. (Inherited from **SeriesView**)
	ToolTipPointTemplateProperty	Identifies the ToolTipPointTemplate dependency property. (Inherited from **SeriesView**)
	ToolTipSeriesPatternProperty	Identifies the ToolTipSeriesPattern dependency property. (Inherited from **SeriesView**)
	ToolTipSeriesTemplateProperty	Identifies the ToolTipSeriesTemplate dependency property. (Inherited from **SeriesView**)
	TransparencyProperty	Identifies the Transparency dependency property.

AreaSeriesView Constructor

Initializes a new instance of the AreaSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public AreaSeriesView()
```

AreaSeriesView Properties

Represents a series view of the Area type.

The following tables list the members exposed by the AreaSeriesView type.

Public Constructors

	Name	Description
	AreaSeriesView	Initializes a new instance of the AreaSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ContourAppearance	Gets or sets the appearance of an area contour.

© 2018 Developer Express Inc.

	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	UpdateLayout	(Inherited from **Windows.UI.Xaml.UIElement**)

Public Fields

	Name	Description
S	AngleProperty	Identifies the Angle dependency property. (Inherited from **MarkerSeriesView**)
S	AntialiasingProperty	Identifies the Antialiasing dependency property. (Inherited from **SeriesView**)
S	BrushProperty	Identifies the Brush dependency property. (Inherited from **CartesianSeriesView**)
S	ColorEachProperty	Identifies the ColorEach dependency property. (Inherited from **CartesianSeriesView**)
S	ContourAppearanceProperty	Identifies the ContourAppearance dependency property.
S	DataChangingAnimationModeProperty	Identifies the DataChangingAnimationMode dependency property. (Inherited from **SeriesView**)
S	LabelOptionsProperty	Identifies the LabelOptions dependency property. (Inherited from **SeriesView**)
S	LegendMarkerTemplateProperty	Identifies the LegendMarkerTemplate dependency property. (Inherited from **SeriesView**)
S	LegendPatternProperty	Identifies the LegendPattern dependency property. (Inherited from **SeriesView**)
S	LegendPointPatternProperty	Identifies the LegendPointPattern dependency property. (Inherited from **SeriesView**)
S	MarkerSizeProperty	Identifies the MarkerSize dependency property.
S	PaletteProperty	Identifies the Palette dependency property. (Inherited from **SeriesView**)

© 2018 Developer Express Inc.

	PointAnimationProperty	Identifies the PointAnimation dependency property. (Inherited from **MarkerSeriesView**)
	RangeControlViewTypeProperty	Identifies the RangeControlViewType dependency property.
	SelectedItemBrushProperty	Identifies the SelectedItemBrush dependency property. (Inherited from **SeriesView**)
	SelectedItemProperty	Identifies the SelectedItem dependency property. (Inherited from **SeriesView**)
	SelectedItemsProperty	Identifies the SelectedItems dependency property. (Inherited from **SeriesView**)
	SeriesAnimationProperty	Identifies the SeriesAnimation dependency property.
	ShowContourProperty	Identifies the ShowContour dependency property.
	ShowLabelsProperty	Identifies the ShowLabels dependency property. (Inherited from **SeriesView**)
	ShowMarkersProperty	Identifies the ShowMarkers dependency property.
	ShowToolTipOnSelectItemProperty	Identifies the ShowToolTipOnSelectItem dependency property. (Inherited from **SeriesView**)
	ToolTipPointPatternProperty	Identifies the ToolTipPointPattern dependency property. (Inherited from **SeriesView**)
	ToolTipPointTemplateProperty	Identifies the ToolTipPointTemplate dependency property. (Inherited from **SeriesView**)
	ToolTipSeriesPatternProperty	Identifies the ToolTipSeriesPattern dependency property. (Inherited from **SeriesView**)
	ToolTipSeriesTemplateProperty	Identifies the ToolTipSeriesTemplate dependency property. (Inherited from **SeriesView**)
	TransparencyProperty	Identifies the Transparency dependency property.

ActualContourAppearance Property

Gets the actual contour appearance.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ActualContourAppearance As ContourAppearance
```
C#
```
public ContourAppearance ActualContourAppearance { get; set; }
```

Property Value

A ContourAppearance object.

See Also
AreaSeriesView Class
AreaSeriesView Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

ContourAppearance Property

Gets or sets the appearance of an area contour.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ContourAppearance As ContourAppearance
```
C#
```
public ContourAppearance ContourAppearance { get; set; }
```

Property Value

ContourAppearance

See Also

MarkerSize Property

Gets or sets the size of data point markers.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property MarkerSize As Integer
```
C#
```
public int MarkerSize { get; set; }
```

Property Value

An integer value which specifies the height and width of the plot area of a marker(s), in pixels.

RangeControlViewType Property

Gets or sets a value that specifies which view type should be used to represent the current series in a Range Control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property RangeControlViewType As RangeControlViewType
```

C#

```
public RangeControlViewType RangeControlViewType { get; set; }
```

Property Value

A RangeControlViewType object.

SeriesAnimation Property

Specifies the series animation.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property SeriesAnimation As AreaAnimationBase
```

C#

```
public AreaAnimationBase SeriesAnimation { get; set; }
```

Property Value

An DevExpress.UI.Xaml.Charts.AreaAnimationBase class descendant, specifying the series animation type.

Remarks

Use the **SeriesAnimation** property to define a preset for animating a series of the Area type.

ShowContour Property

Gets or sets a value indicating whether or not it is necessary to show the contour for this series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ShowContour As Boolean
```

C#

```
public bool ShowContour { get; set; }
```

Property Value

true, to show the contour; otherwise, **false**.

Remarks

The contour appearance is defined by the ContourAppearance property.

ShowMarkers Property

Gets or sets a value indicating whether series point markers are visible.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ShowMarkers As Boolean
```
C#
```
public bool ShowMarkers { get; set; }
```

Property Value

true to show markers; **false** to hide them.

Transparency Property

Specifies the transparency (**0**-**1**) to use for displaying the filled color area series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Transparency As Double
```
C#
```
public Double Transparency { get; set; }
```

Property Value

A System.Double value from **0** (opaque) to **1** (transparent).

AxisAlignment Enumeration

Lists the values used to specify an axis alignment.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum AxisAlignment
```
C#
```
public enum AxisAlignment
```

Members

Name	Description
Far	The axis is displayed at the right or top side of the chart area, depending on its type and orientation.
Near	The axis is displayed at the left or bottom side of the chart area, depending on its type and orientation.

Remarks

Values listed by the **AxisAlignment** enumeration are used to set the AxisBase.Alignment property.

AxisBase Class

The base class for classes that provide axes functionality for a chart control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AxisBase Inherits ChartElement
```

C#

```
public abstract class AxisBase : ChartElement
```

Remarks

The **AxisBase** class serves as a base for the AxisX and AxisY classes. The properties and methods defined by the **AxisBase** class implement the base axes functionality and are common to all axes.

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.__ComObject
      System.Runtime.InteropServices.WindowsRuntime.RuntimeClass

AxisBase Members

The base class for classes that provide axes functionality for a chart control.

The following tables list the members exposed by the AxisBase type.

Public Constructors

	Name	Description
	AxisBase	Initializes a new instance of the AxisBase class with default settings.

Public Properties

	Name	Description
	ActualGridLinesMinorStrokeStyle	Gets the actual stroke style of minor grid lines.
	ActualGridLinesStrokeStyle	Gets the actual stroke style of major grid lines.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options.
	ActualVisualRange	Gets the actual visual range of an axis.
	ActualWholeRange	Gets the actual whole range of an axis.
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis. This is a dependency property.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

© 2018 Developer Express Inc.

	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the axis. This is a dependency property.
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DateTimeGridAlignment	Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and labels should be aligned.
	DateTimeMeasureUnit	Gets or sets the detail level for date-time values.

© 2018 Developer Express Inc.

	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	DoubleTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	DragEnterEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	DragLeaveEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	DragOverEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	DropEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	FlowDirection	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	FlowDirectionProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	FocusState	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FocusStateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontFamily	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontFamilyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontSize	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontSizeProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStretch	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStretchProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyle	(Inherited from **Windows.UI.Xaml.Controls.Control**

© 2018 Developer Express Inc.

		)
S	FontStyleProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeight	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontWeightProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Foreground	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	ForegroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	GridLinesBrush	Gets or sets the color of the axis grid lines.
	GridLinesMinorBrush	Specifies the color of the axis minor grid lines.
	GridLinesMinorStrokeStyle	Specifies the line style settings for the axis' minor grid lines.
	GridLinesStrokeStyle	Specifies the line style settings for the axis' major grid lines.
	GridSpacing	Gets or sets the numeric interval between the axis' gridlines.
	GridSpacingAuto	Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis.
	Height	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	HeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	HoldingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	HorizontalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	HorizontalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HorizontalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	HorizontalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	Interlaced	Gets or sets whether interlacing is applied to the axis.
	InterlacedBrush	Gets or sets the color of the axis interlacing.
	IsDoubleTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsDoubleTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsHitTestVisible	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsHitTestVisibleProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsHoldingEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsRightTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTabStop	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTabStopProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsTemplateFocusTargetProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTextScaleFactorEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTextScaleFactorEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	KeyDownEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	KeyUpEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	LabelOptions	Provides access to the settings of axis labels.
	Language	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	LanguageProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ManipulationCompletedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationDeltaEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationInertiaStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
S	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
S	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Reverse	Gets or sets a value indicating whether the axis is reversed. This is a dependency property.
S	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this axis.
	ShowLine	Gets or sets a value indicating whether or not to draw the axis line.
	ShowMajorGridlines	Specifies whether or not to show major gridlines.
	ShowMajorTickmarks	Specifies whether or not the major tickmarks are visible.
	ShowMinorGridlines	Specifies whether or not to show minor gridlines.
	ShowMinorTickmarks	Specifies whether or not the axis minor tickmarks are visible.
	Strips	Provides access to the collection of axis strips. This is a dependency property.
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElem**

	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Thickness	Gets or sets the thickness of the axis. This is a dependency property.
	TickmarksCrossAxis	Specifies whether or not tickmarks cross the axis.
	TickmarksLength	Specifies the length (in pixels) of axis major tick marks.
	TickmarksMinorLength	Specifies the length (in pixels) of axis minor tickmarks.
	TickmarksMinorThickness	Specifies the thickness (in pixels) of minor tickmarks.
	TickmarksThickness	Specifies the thickness (in pixels) of major tickmarks.
	Title	Provides access to the title settings of an axis.
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)

AxisBase Constructor

Initializes a new instance of the AxisBase class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public AxisBase()
```

AxisBase Properties

The base class for classes that provide axes functionality for a chart control.

The following tables list the members exposed by the AxisBase type.

Public Constructors

	Name	Description
	AxisBase	Initializes a new instance of the AxisBase class with default settings.

Public Properties

	Name	Description
	ActualGridLinesMinorStrokeStyle	Gets the actual stroke style of minor grid lines.
	ActualGridLinesStrokeStyle	Gets the actual stroke style of major grid lines.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options.
	ActualVisualRange	Gets the actual visual range of an axis.
	ActualWholeRange	Gets the actual whole range of an axis.
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis. This is a dependency property.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

© 2018 Developer Express Inc.

	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the axis. This is a dependency property.
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DateTimeGridAlignment	Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and labels should be aligned.
	DateTimeMeasureUnit	Gets or sets the detail level for date-time values.

S	FontStyleProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeight	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontWeightProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Foreground	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	ForegroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	GridLinesBrush	Gets or sets the color of the axis grid lines.
	GridLinesMinorBrush	Specifies the color of the axis minor grid lines.
	GridLinesMinorStrokeStyle	Specifies the line style settings for the axis' minor grid lines.
	GridLinesStrokeStyle	Specifies the line style settings for the axis' major grid lines.
	GridSpacing	Gets or sets the numeric interval between the axis' gridlines.
	GridSpacingAuto	Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis.
	Height	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	HeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	HoldingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	HorizontalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

	Interlaced	Gets or sets whether interlacing is applied to the axis.
	InterlacedBrush	Gets or sets the color of the axis interlacing.
	IsDoubleTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsDoubleTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsHitTestVisible	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsHitTestVisibleProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsHoldingEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsRightTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTabStop	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTabStopProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
S	IsTemplateFocusTargetProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTextScaleFactorEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTextScaleFactorEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	KeyDownEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	KeyUpEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	LabelOptions	Provides access to the settings of axis labels.
	Language	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	LanguageProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ManipulationCompletedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationDeltaEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationInertiaStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationStartedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Margin	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MarginProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
S	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
S	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Reverse	Gets or sets a value indicating whether the axis is reversed. This is a dependency property.
S	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this axis.
	ShowLine	Gets or sets a value indicating whether or not to draw the axis line.
	ShowMajorGridlines	Specifies whether or not to show major gridlines.
	ShowMajorTickmarks	Specifies whether or not the major tickmarks are visible.
	ShowMinorGridlines	Specifies whether or not to show minor gridlines.
	ShowMinorTickmarks	Specifies whether or not the axis minor tickmarks are visible.
	Strips	Provides access to the collection of axis strips. This is a dependency property.
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElem**

		ent)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Thickness	Gets or sets the thickness of the axis. This is a dependency property.
	TickmarksCrossAxis	Specifies whether or not tickmarks cross the axis.
	TickmarksLength	Specifies the length (in pixels) of axis major tick marks.
	TickmarksMinorLength	Specifies the length (in pixels) of axis minor tickmarks.
	TickmarksMinorThickness	Specifies the thickness (in pixels) of minor tickmarks.
	TickmarksThickness	Specifies the thickness (in pixels) of major tickmarks.
	Title	Provides access to the title settings of an axis.
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)

ActualGridLinesMinorStrokeStyle Property

Gets the actual stroke style of minor grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property ActualGridLinesMinorStrokeStyle As StrokeStyle
```

C#

```
public StrokeStyle ActualGridLinesMinorStrokeStyle { get; }
```

Property Value

A StrokeStyle object.

ActualGridLinesStrokeStyle Property

Gets the actual stroke style of major grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualGridLinesStrokeStyle As StrokeStyle
```
C#
```
public StrokeStyle ActualGridLinesStrokeStyle { get; }
```

Property Value

A StrokeStyle object.

ActualLabelOptions Property

Gets the actual label options.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualLabelOptions As AxisLabelOptions
```
C#
```
public AxisLabelOptions ActualLabelOptions { get; }
```

Property Value

An AxisLabelOptions object.

ActualVisualRange Property

Gets the actual visual range of an axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property ActualVisualRange As VisualAxisRange
```

C#

```
public VisualAxisRange ActualVisualRange { get; }
```

Property Value

A VisualAxisRange object.

ActualWholeRange Property

Gets the actual whole range of an axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property ActualWholeRange As WholeAxisRange
```

C#

```
public WholeAxisRange ActualWholeRange { get; }
```

Property Value

A WholeAxisRange object.

Alignment Property

Gets or sets the alignment of the axis. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Alignment As AxisAlignment
```

C#

```
public AxisAlignment Alignment { get; set; }
```

Property Value

An AxisAlignment enumeration value which specifies the alignment of the axis.

Brush Property

Gets or sets the color of the axis. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Brush As SolidColorBrush
```
C#
```
public SolidColorBrush Brush { get; set; }
```

Property Value

SolidColorBrush

DateTimeGridAlignment Property

Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and labels should be aligned.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property DateTimeGridAlignment As DateTimeMeasureUnit
```

C#

```
public DateTimeMeasureUnit DateTimeGridAlignment { get; set; }
```

Property Value

A DateTimeMeasureUnit enumeration value representing the measurement unit to which the beginning of a diagram's gridlines and labels should be aligned.

Remarks

This property is in effect when the DataPointCollection.ArgumentScaleType or DataPointCollection.ValueScaleType property is set to ScaleType.DateTime.

To maintain date-time values at different detail levels, use the DateTimeMeasureUnit property.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.	

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;
                points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            }
            return points;
        }
        protected double GenerateStartValue(Random random) {
            return Start + random.NextDouble() * 100;
        }
        protected double GenerateAddition(Random random) {
            double factor = random.NextDouble();
            if (factor == 1)
                factor = 50;
            else if (factor == 0)
                factor = -50;
            return (factor - 0.5) * 50;
        }
    }

DateTimeMeasureUnit Property

Gets or sets the detail level for date-time values.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property DateTimeMeasureUnit As DateTimeMeasureUnit
```

C#

```
public DateTimeMeasureUnit DateTimeMeasureUnit { get; set; }
```

Property Value

A DateTimeMeasureUnit enumeration value which represents the axis' detail level.

Remarks

This property is available when the DataPointCollection.ArgumentScaleType or DataPointCollection.ValueScaleType property is set to **DateTime**.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```

GridLinesBrush Property

Gets or sets the color of the axis grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property GridLinesBrush As SolidColorBrush
```

C#

```
public SolidColorBrush GridLinesBrush { get; set; }
```

Property Value

A SolidColorBrush object which specifies the color of the grid lines.

Remarks

Before using the **GridLinesBrush** property, make sure the ShowMajorGridlines property is set to **true**.

GridLinesMinorBrush Property

Specifies the color of the axis minor grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property GridLinesMinorBrush As SolidColorBrush
```

C#

```
public SolidColorBrush GridLinesMinorBrush { get; set; }
```

Property Value

A SolidColorBrush object which specifies the color of the minor grid lines.

Remarks

Before using the **GridLinesMinorBrush** property, make sure the ShowMinorGridlines property is set to **true**.

GridLinesMinorStrokeStyle Property

Specifies the line style settings for the axis' minor grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property GridLinesMinorStrokeStyle As StrokeStyle
```

C#

```
public StrokeStyle GridLinesMinorStrokeStyle { get; set; }
```

Property Value

A StrokeStyle object.

GridLinesStrokeStyle Property

Specifies the line style settings for the axis' major grid lines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property GridLinesStrokeStyle As StrokeStyle
```

C#

```
public StrokeStyle GridLinesStrokeStyle { get; set; }
```

Property Value

A StrokeStyle object.

GridSpacing Property

Gets or sets the numeric interval between the axis' gridlines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property GridSpacing As Double
```
C#
```
public Double GridSpacing { get; set; }
```

Property Value

A System.Double value which specifies the interval between gridlines.

GridSpacingAuto Property

Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property GridSpacingAuto As Boolean
```
C#
```
public bool GridSpacingAuto { get; set; }
```

Property Value

true, if grid spacing is performed automatically; otherwise, **false**.

Interlaced Property

Gets or sets whether interlacing is applied to the axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Interlaced As Boolean
```

C#

```
public bool Interlaced { get; set; }
```

Property Value

true to apply interlacing; otherwise, **false**.

Remarks

To specify the interlaced color, use the InterlacedBrush property.

InterlacedBrush Property

Gets or sets the color of the axis interlacing.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property InterlacedBrush As SolidColorBrush
```

C#

```
public SolidColorBrush InterlacedBrush { get; set; }
```

Property Value

A SolidColorBrush object which specifies the color of the interlaced grid lines.

Remarks

Before using the **InterlacedBrush** property, make sure the Interlaced property is set to **true**.

LabelOptions Property

Provides access to the settings of axis labels.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property LabelOptions As AxisLabelOptions
```

C#

```
public AxisLabelOptions LabelOptions { get; set; }
```

Property Value

An AxisLabelOptions object which provides the axis label settings.

Remarks

Use the **LabelOptions** property to get access to the settings that specify the position and text format of axis labels.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;
                points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            }
            return points;
        }
        protected double GenerateStartValue(Random random) {
            return Start + random.NextDouble() * 100;
        }
        protected double GenerateAddition(Random random) {
            double factor = random.NextDouble();
            if (factor == 1)
                factor = 50;
            else if (factor == 0)
                factor = -50;
            return (factor - 0.5) * 50;
        }
    }
}
```

Visual Basic

MinorCount Property

Gets or sets the number of minor tickmarks and gridlines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property MinorCount As Integer
```

C#

```
public int MinorCount { get; set; }
```

Property Value

An integer value which specifies the number of minor tickmarks between two major tickmarks. The same value specifies the number of grid lines.

See Also

AxisBase Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

Reverse Property

Gets or sets a value indicating whether the axis is reversed. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Reverse As Boolean
```

C#

```
public bool Reverse { get; set; }
```

Property Value

true, to reverse the axis; otherwise, **false**.

Remarks

Use the **Reverse** property to rotate a diagram's axes:

- If the horizontal axis is reversed, it's numbered from right to left.
- If the vertical axis is reversed, it's numbered from top to bottom.

ShowLabels Property

Gets or sets a value indicating whether labels should be visible for this axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ShowLabels As Boolean
```
C#
```
public bool ShowLabels { get; set; }
```

Property Value

A Boolean object.

ShowLine Property

Gets or sets a value indicating whether or not to draw the axis line.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ShowLine As Boolean
```
C#
```
public bool ShowLine { get; set; }
```

Property Value

true, to draw the axis line; otherwise, **false**.

ShowMajorGridlines Property

Specifies whether or not to show major gridlines.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ShowMajorGridlines As Boolean
```
C#
```
public bool ShowMajorGridlines { get; set; }
```

Property Value

true, to display major gridlines; otherwise - **false**;

Strips Property

Provides access to the collection of axis strips. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property Strips As StripCollection
```

C#

```
public StripCollection Strips { get; }
```

Property Value

A StripCollection object which represents the collection of axis strips.

Remarks

The **Strips** property provides access to an axis' collection of strips, each represented by a Strip object.

For more information, refer to Strip.

Thickness Property

Gets or sets the thickness of the axis. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Thickness As Integer
```
C#
```
public int Thickness { get; set; }
```

Property Value

An integer value which specifies the thickness of the axis, in pixels.

TickmarksCrossAxis Property

Specifies whether or not tickmarks cross the axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property TickmarksCrossAxis As Boolean
```
C#
```
public bool TickmarksCrossAxis { get; set; }
```

Property Value

true, if tickmarks should cross the axis; otherwise, **false**.

Visible Property

Gets or sets a value indicating whether the axis is visible.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Visible As Boolean
```
C#
```
public bool Visible { get; set; }
```

Property Value

true, if the axis is visible; otherwise, **false**.

VisualRange Property

Gets or sets the settings that specify the visible range of the axis coordinates.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property VisualRange As VisualAxisRange
```

C#

```
public VisualAxisRange VisualRange { get; set; }
```

Property Value

A VisualAxisRange object which contains the common visual range settings of the axis coordinates.

WholeRange Property

Gets or sets the range through which it's possible to scroll an axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property WholeRange As WholeAxisRange
```

C#

```
public WholeAxisRange WholeRange { get; set; }
```

Property Value

A WholeAxisRange object representing the settings for the whole range of an axis.

AxisLabelOptions Class

Contains options that define appearance and behavior of axis labels.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AxisLabelOptions Inherits ChartElement
```

C#

```
public class AxisLabelOptions : ChartElement
```

Remarks

An instance of the **AxisLabelOptions** class is available via the AxisBase.LabelOptions property.

The **AxisLabelOptions** class provides different settings that define the text of axis labels (Pattern), the position of axis labels (Angle) and others.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

AxisLabelOptions Members

Contains options that define appearance and behavior of axis labels.

The following tables list the members exposed by the AxisLabelOptions type.

Public Constructors

	Name	Description
	AxisLabelOptions	Initializes a new instance of the AxisLabelOptions class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle by which the axis label's text is rotated.
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)

AxisLabelOptions Constructor

Initializes a new instance of the AxisLabelOptions class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public AxisLabelOptions()
```

AxisLabelOptions Properties

Contains options that define appearance and behavior of axis labels.

The following tables list the members exposed by the AxisLabelOptions type.

Public Constructors

	Name	Description
	AxisLabelOptions	Initializes a new instance of the AxisLabelOptions class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle by which the axis label's text is rotated.
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

Angle Property

Gets or sets the angle by which the axis label's text is rotated.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Angle As Double
```

C#

```
public Double Angle { get; set; }
```

Property Value

A System.Double value specifying the angle, in degrees, by which the axis label's text is rotated.

Remarks

The angle which is specified by this property is measured in degrees, and clockwise from the horizontal.

ElementTemplate Property

Gets or sets a template that defines a custom appearance and look-and-feel of a label.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ElementTemplate As DataTemplate
```
C#
```
public DataTemplate ElementTemplate { get; set; }
```

Property Value

A **System.Windows.DataTemplate** object representing a custom template.

See Also

DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

Pattern Property

Gets or sets a string which represents the pattern specifying the text to be displayed within the axis labels that appears for a diagram X - axis or Y- axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Pattern As String
```

C#

```
public string Pattern { get; set; }
```

Property Value

A System.String, which represents the pattern. The default value is System.String.Empty.

Remarks

Use the **Pattern** property to define a pattern for displaying text by axis labels. Various placeholders enclosed in braces correspond to the available display patterns. For example, you can use either the {A} pattern for the X-axis, or the {V} pattern for the Y-axis, together with the format specifiers.

The available placeholders are detailed below.

Pattern	Description
{A}	A series point *argument*.
{V}	A series point *value*.
{VP}	A series point's *value* as a percent.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

© 2018 Developer Express Inc.

C#

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }

AxisRangeBase Class

The base class for all axis ranges.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AxisRangeBase Inherits ChartElement
```

C#

```
public abstract class AxisRangeBase : ChartElement
```

Remarks

The **AxisRangeBase** class introduces the StartValue and EndValue properties that define the start and end limits of a range. These properties are defined in numerical, date-time, or string values - according to the actual scale type used by an axis.

In addition, the **AxisRangeBase** class introduces the StartValueInternal and EndValueInternal properties that allow you to specify range limits in internal numerical values.

EndValue Property

Gets or sets the value identifying the end of the range.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property EndValue As Object
```

C#

```
public object EndValue { get; set; }
```

Property Value

A System.Object that specifies the end value of the range.

See Also

EndValueInternal Property

Gets or sets the internal numerical representation of the range end value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property EndValueInternal As Double
```
C#
```
public Double EndValueInternal { get; set; }
```

Property Value

A System.Double value which specifies the internal representation of the range end value.

StartValue Property

Gets or sets the value identifying the start of the range.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property StartValue As Object
```

C#

```
public object StartValue { get; set; }
```

Property Value

A System.Object that specifies the start value of the range.

StartValueInternal Property

Gets or sets the internal numerical representation of the range start value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property StartValueInternal As Double
```
C#
```
public Double StartValueInternal { get; set; }
```

Property Value

A System.Double value which specifies the internal representation of the range start value.

SetInternalValues Method

Sets both the start and end internal values of an axis range.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub SetInternalValues(
   ByVal start As Double,
   ByVal end As Double
)
```
C#
```
public void SetInternalValues(
   Double start,
   Double end
)
```

Parameters
start
A System.Double value which specifies the start internal value to be set.
end
A System.Double value which specifies the end internal value to be set.

SetValues Method

Sets both the start and end values of an axis range.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub SetValues(
   ByVal start As Object,
   ByVal end As Object
)
```
C#
```
public void SetValues(
   object start,
   object end
)
```

Parameters
start
A System.Object which specifies the start set value. The type of an object depends on the data scale type.
end
A System.Object which specifies the end set value. The type of an object depends on the data scale type.

AxisTitle Class

Defines the common settings of an axis title.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AxisTitle Inherits ChartElement, IAxisTitle
```

C#

```
public class AxisTitle : ChartElement, IAxisTitle
```

Remarks

The **AxisTitle** class declares properties that define the common appearance settings of a title which is displayed by a particular axis.

Properties exposed via the **AxisTitle** class allow you to customize common title attributes, such as:

- the axis title's text (Content);
- the alignment of the axis title (Alignment).

For more information, refer to Axis Title.

Inheritance Hierarchy

System.Object

AxisTitle Members

Defines the common settings of an axis title.

The following tables list the members exposed by the AxisTitle type.

Public Constructors

	Name	Description
	AxisTitle	Initializes a new instance of the AxisTitle class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis title.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)

AxisTitle Constructor

Initializes a new instance of the AxisTitle class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public AxisTitle()
```

AxisTitle Properties

Defines the common settings of an axis title.

The following tables list the members exposed by the AxisTitle type.

Public Constructors

	Name	Description
	AxisTitle	Initializes a new instance of the AxisTitle class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis title.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)

Alignment Property

Gets or sets the alignment of the axis title.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Alignment As TitleAlignment
```
C#
```
public TitleAlignment Alignment { get; set; }
```

Property Value

A TitleAlignment enumeration value which specifies the alignment of the axis title.

Content Property

Gets or sets the title's content. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Content As Object
```

C#

```
public object Content { get; set; }
```

Property Value

An System.Object value that represents the title's content.

ContentTemplate Property

Gets or sets the template that defines the presentation of the title's content, represented by the Content property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ContentTemplate As DataTemplate
```

C#

```
public DataTemplate ContentTemplate { get; set; }
```

Property Value

A **System.Windows.DataTemplate** object, representing the template which defines the presentation of the title's content.

Visible Property

Gets or sets a value indicating whether the axis title is visible.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Visible As Boolean
```
C#
```
public bool Visible { get; set; }
```

Property Value

true, if the title is visible; otherwise, **false**.

AxisX Class

Represents the X-Axis for 2D charts.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class AxisX Inherits AxisBase
```

C#

```
public class AxisX : AxisBase
```

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;

AxisX Members

Represents the X-Axis for 2D charts.

The following tables list the members exposed by the AxisX type.

Public Constructors

	Name	Description
	AxisX	Initializes a new instance of the AxisX class with default settings.

Public Properties

	Name	Description
	ActualGridLinesMinorStrokeStyle	Gets the actual stroke style of minor grid lines. (Inherited from **AxisBase**)
	ActualGridLinesStrokeStyle	Gets the actual stroke style of major grid lines. (Inherited from **AxisBase**)
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **AxisBase**)
	ActualVisualRange	Gets the actual visual range of an axis. (Inherited from **AxisBase**)
	ActualWholeRange	Gets the actual whole range of an axis. (Inherited from **AxisBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis. This is a dependency property. (Inherited from **AxisBase**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the axis. This is a dependency property. (Inherited from **AxisBase**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DateTimeGridAlignment	Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and

© 2018 Developer Express Inc.

		labels should be aligned. (Inherited from **AxisBase**)
	DateTimeMeasureUnit	Gets or sets the detail level for date-time values. (Inherited from **AxisBase**)
S	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	DoubleTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragEnterEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragLeaveEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragOverEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DropEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	FlowDirection	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	FlowDirectionProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	FocusState	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FocusStateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontFamily	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontFamilyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

S	FontSizeProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStretch	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	FontStretchProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyle	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyleProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeight	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeightProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Foreground	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	ForegroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	GridLinesBrush	Gets or sets the color of the axis grid lines. (Inherited from **AxisBase**)
	GridLinesMinorBrush	Specifies the color of the axis minor grid lines. (Inherited from **AxisBase**)
	GridLinesMinorStrokeStyle	Specifies the line style settings for the axis' minor grid lines. (Inherited from **AxisBase**)
	GridLinesStrokeStyle	Specifies the line style settings for the axis' major grid lines. (Inherited from **AxisBase**)
	GridSpacing	Gets or sets the numeric interval between the axis' gridlines. (Inherited from **AxisBase**)
	GridSpacingAuto	Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis. (Inherited from **AxisBase**)
	Height	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HoldingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	HorizontalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this axis. (Inherited from **AxisBase**)
	ShowLine	Gets or sets a value indicating whether or not to draw the axis line. (Inherited from **AxisBase**)
	ShowMajorGridlines	Specifies whether or not to show major gridlines. (Inherited from **AxisBase**)
	ShowMajorTickmarks	Specifies whether or not the major tickmarks are visible. (Inherited from **AxisBase**)
	ShowMinorGridlines	Specifies whether or not to show minor gridlines. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	ShowMinorTickmarks	Specifies whether or not the axis minor tickmarks are visible. (Inherited from **AxisBase**)
	Strips	Provides access to the collection of axis strips. This is a dependency property. (Inherited from **AxisBase**)
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Thickness	Gets or sets the thickness of the axis. This is a dependency property. (Inherited from **AxisBase**)
	TickmarksCrossAxis	Specifies whether or not tickmarks cross the axis. (Inherited from **AxisBase**)
	TickmarksLength	Specifies the length (in pixels) of axis major tick marks. (Inherited from **AxisBase**)
	TickmarksMinorLength	Specifies the length (in pixels) of axis minor tickmarks. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	TickmarksMinorThickness	Specifies the thickness (in pixels) of minor tickmarks. (Inherited from **AxisBase**)
	TickmarksThickness	Specifies the thickness (in pixels) of major tickmarks. (Inherited from **AxisBase**)
	Title	Provides access to the title settings of an axis. (Inherited from **AxisBase**)
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)
S	TransitionsProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Triggers	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	UseLayoutRounding	(Inherited from **Windows.UI.Xaml.UIElement**)
S	UseLayoutRoundingProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	UseSystemFocusVisuals	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	UseSystemFocusVisualsProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	VerticalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	VerticalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	VerticalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	VerticalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Visibility	(Inherited from **Windows.UI.Xaml.UIElement**)
S	VisibilityProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Visible	Gets or sets a value indicating whether the axis is visible. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	VisualRange	Gets or sets the settings that specify the visible range of the axis coordinates. (Inherited from **AxisBase**)
	WholeRange	Gets or sets the range through which it's possible to scroll an axis. (Inherited from **AxisBase**)
	Width	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	WidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

AxisY Members

Represents the Y-Axis for 2D charts.

The following tables list the members exposed by the AxisY type.

Public Constructors

	Name	Description
	AxisY	Initializes a new instance of the AxisY class with default settings.

Public Properties

	Name	Description
	ActualGridLinesMinorStrokeStyle	Gets the actual stroke style of minor grid lines. (Inherited from **AxisBase**)
	ActualGridLinesStrokeStyle	Gets the actual stroke style of major grid lines. (Inherited from **AxisBase**)
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **AxisBase**)
	ActualVisualRange	Gets the actual visual range of an axis. (Inherited from **AxisBase**)
	ActualWholeRange	Gets the actual whole range of an axis. (Inherited from **AxisBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis. This is a dependency property. (Inherited from **AxisBase**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
S	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the axis. This is a dependency property. (Inherited from **AxisBase**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DateTimeGridAlignment	Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and

© 2018 Developer Express Inc.

		labels should be aligned. (Inherited from **AxisBase**)
	DateTimeMeasureUnit	Gets or sets the detail level for date-time values. (Inherited from **AxisBase**)
S	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	DoubleTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragEnterEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragLeaveEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragOverEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DropEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	FlowDirection	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	FlowDirectionProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	FocusState	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FocusStateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontFamily	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontFamilyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontSize	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontSizeProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStretch	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	FontStretchProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyle	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyleProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeight	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeightProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Foreground	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	ForegroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	GridLinesBrush	Gets or sets the color of the axis grid lines. (Inherited from **AxisBase**)
	GridLinesMinorBrush	Specifies the color of the axis minor grid lines. (Inherited from **AxisBase**)
	GridLinesMinorStrokeStyle	Specifies the line style settings for the axis' minor grid lines. (Inherited from **AxisBase**)
	GridLinesStrokeStyle	Specifies the line style settings for the axis' major grid lines. (Inherited from **AxisBase**)
	GridSpacing	Gets or sets the numeric interval between the axis' gridlines. (Inherited from **AxisBase**)
	GridSpacingAuto	Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis. (Inherited from **AxisBase**)
	Height	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HoldingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	HorizontalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

© 2018 Developer Express Inc.

	HorizontalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HorizontalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	HorizontalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Interlaced	Gets or sets whether interlacing is applied to the axis. (Inherited from **AxisBase**)
	InterlacedBrush	Gets or sets the color of the axis interlacing. (Inherited from **AxisBase**)
	IsDoubleTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsDoubleTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsHitTestVisible	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHitTestVisibleProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTabStop	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTabStopProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTemplateFocusTargetProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	IsTextScaleFactorEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTextScaleFactorEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	KeyDownEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	KeyUpEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	LabelOptions	Provides access to the settings of axis labels. (Inherited from **AxisBase**)
	Language	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	LanguageProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ManipulationCompletedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

	PointerPressedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerReleasedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerWheelChangedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Reverse	Gets or sets a value indicating whether the axis is reversed. This is a dependency property. (Inherited from **AxisBase**)
	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this axis. (Inherited from **AxisBase**)
	ShowLine	Gets or sets a value indicating whether or not to draw the axis line. (Inherited from **AxisBase**)
	ShowMajorGridlines	Specifies whether or not to show major gridlines. (Inherited from **AxisBase**)
	ShowMajorTickmarks	Specifies whether or not the major tickmarks are visible. (Inherited from **AxisBase**)
	ShowMinorGridlines	Specifies whether or not to show minor gridlines. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	ShowMinorTickmarks	Specifies whether or not the axis minor tickmarks are visible. (Inherited from **AxisBase**)
	ShowZeroValue	Gets or sets a value indicating whether the Y-axis range should be automatically recalculated to make the zero level constantly visible.
	Strips	Provides access to the collection of axis strips. This is a dependency property. (Inherited from **AxisBase**)
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Thickness	Gets or sets the thickness of the axis. This is a dependency property. (Inherited from **AxisBase**)
	TickmarksCrossAxis	Specifies whether or not tickmarks cross the axis. (Inherited from **AxisBase**)
	TickmarksLength	Specifies the length (in pixels) of axis major tick marks. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	TickmarksMinorLength	Specifies the length (in pixels) of axis minor tickmarks. (Inherited from **AxisBase**)
	TickmarksMinorThickness	Specifies the thickness (in pixels) of minor tickmarks. (Inherited from **AxisBase**)
	TickmarksThickness	Specifies the thickness (in pixels) of major tickmarks. (Inherited from **AxisBase**)
	Title	Provides access to the title settings of an axis. (Inherited from **AxisBase**)
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)

AxisY Constructor

Initializes a new instance of the AxisY class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public AxisY()
```

AxisY Properties

Represents the Y-Axis for 2D charts.

The following tables list the members exposed by the AxisY type.

Public Constructors

	Name	Description
	AxisY	Initializes a new instance of the AxisY class with default settings.

Public Properties

	Name	Description
	ActualGridLinesMinorStrokeStyle	Gets the actual stroke style of minor grid lines. (Inherited from **AxisBase**)
	ActualGridLinesStrokeStyle	Gets the actual stroke style of major grid lines. (Inherited from **AxisBase**)
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **AxisBase**)
	ActualVisualRange	Gets the actual visual range of an axis. (Inherited from **AxisBase**)
	ActualWholeRange	Gets the actual whole range of an axis. (Inherited from **AxisBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Alignment	Gets or sets the alignment of the axis. This is a dependency property. (Inherited from **AxisBase**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the axis. This is a dependency property. (Inherited from **AxisBase**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DateTimeGridAlignment	Gets or sets the date-time measurement unit, to which the beginning of a diagram's gridlines and

© 2018 Developer Express Inc.

		labels should be aligned. (Inherited from **AxisBase**)
	DateTimeMeasureUnit	Gets or sets the detail level for date-time values. (Inherited from **AxisBase**)
S	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	DoubleTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragEnterEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragLeaveEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DragOverEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	DropEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	FlowDirection	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	FlowDirectionProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	FocusState	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FocusStateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontFamily	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontFamilyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontSize	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	FontSizeProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStretch	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	FontStretchProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyle	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontStyleProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeight	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	FontWeightProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Foreground	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	ForegroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	GridLinesBrush	Gets or sets the color of the axis grid lines. (Inherited from **AxisBase**)
	GridLinesMinorBrush	Specifies the color of the axis minor grid lines. (Inherited from **AxisBase**)
	GridLinesMinorStrokeStyle	Specifies the line style settings for the axis' minor grid lines. (Inherited from **AxisBase**)
	GridLinesStrokeStyle	Specifies the line style settings for the axis' major grid lines. (Inherited from **AxisBase**)
	GridSpacing	Gets or sets the numeric interval between the axis' gridlines. (Inherited from **AxisBase**)
	GridSpacingAuto	Gets or sets a value that specifies whether the spacing of gridlines is calculated automatically based upon the major tickmarks of the axis. (Inherited from **AxisBase**)
	Height	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HoldingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	HorizontalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

© 2018 Developer Express Inc.

	HorizontalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	HorizontalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	HorizontalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Interlaced	Gets or sets whether interlacing is applied to the axis. (Inherited from **AxisBase**)
	InterlacedBrush	Gets or sets the color of the axis interlacing. (Inherited from **AxisBase**)
	IsDoubleTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsDoubleTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsHitTestVisible	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHitTestVisibleProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTabStop	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTabStopProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTemplateFocusTargetProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	IsTextScaleFactorEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	IsTextScaleFactorEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	KeyDownEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	KeyUpEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	LabelOptions	Provides access to the settings of axis labels. (Inherited from **AxisBase**)
	Language	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	LanguageProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ManipulationCompletedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ManipulationDeltaEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

S	PointerExitedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	PointerMovedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	PointerPressedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerReleasedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerWheelChangedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Reverse	Gets or sets a value indicating whether the axis is reversed. This is a dependency property. (Inherited from **AxisBase**)
	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this axis. (Inherited from **AxisBase**)
	ShowLine	Gets or sets a value indicating whether or not to draw the axis line. (Inherited from **AxisBase**)
	ShowMajorGridlines	Specifies whether or not to show major gridlines. (Inherited from **AxisBase**)
	ShowMajorTickmarks	Specifies whether or not the major tickmarks are visible. (Inherited from **AxisBase**)
	ShowMinorGridlines	Specifies whether or not to show minor gridlines. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	ShowMinorTickmarks	Specifies whether or not the axis minor tickmarks are visible. (Inherited from **AxisBase**)
	ShowZeroValue	Gets or sets a value indicating whether the Y-axis range should be automatically recalculated to make the zero level constantly visible.
	Strips	Provides access to the collection of axis strips. This is a dependency property. (Inherited from **AxisBase**)
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Thickness	Gets or sets the thickness of the axis. This is a dependency property. (Inherited from **AxisBase**)
	TickmarksCrossAxis	Specifies whether or not tickmarks cross the axis. (Inherited from **AxisBase**)
	TickmarksLength	Specifies the length (in pixels) of axis major tick marks. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	TickmarksMinorLength	Specifies the length (in pixels) of axis minor tickmarks. (Inherited from **AxisBase**)
	TickmarksMinorThickness	Specifies the thickness (in pixels) of minor tickmarks. (Inherited from **AxisBase**)
	TickmarksThickness	Specifies the thickness (in pixels) of major tickmarks. (Inherited from **AxisBase**)
	Title	Provides access to the title settings of an axis. (Inherited from **AxisBase**)
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)
	TransitionsProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Triggers	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	UseLayoutRounding	(Inherited from **Windows.UI.Xaml.UIElement**)
	UseLayoutRoundingProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	UseSystemFocusVisuals	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	UseSystemFocusVisualsProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	VerticalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	VerticalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	VerticalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	VerticalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Visibility	(Inherited from **Windows.UI.Xaml.UIElement**)
	VisibilityProperty	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	Visible	Gets or sets a value indicating whether the axis is visible. (Inherited from **AxisBase**)
	VisualRange	Gets or sets the settings that specify the visible range of the axis coordinates. (Inherited from **AxisBase**)
	WholeRange	Gets or sets the range through which it's possible to scroll an axis. (Inherited from **AxisBase**)
	Width	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	WidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

S	ShowLabelsProperty	Identifies the ShowLabels dependency property. (Inherited from **AxisBase**)
S	ShowLineProperty	Identifies the ShowLine dependency property. (Inherited from **AxisBase**)
S	ShowMajorGridlinesProperty	Identifies the ShowMajorGridlines dependency property. (Inherited from **AxisBase**)
S	ShowMajorTickmarksProperty	Identifies the ShowMajorTickmarks dependency property. (Inherited from **AxisBase**)
S	ShowMinorGridlinesProperty	Identifies the ShowMinorGridlines dependency property. (Inherited from **AxisBase**)
S	ShowMinorTickmarksProperty	Identifies the ShowMinorTickmarks dependency property. (Inherited from **AxisBase**)
S	ShowZeroValueProperty	Identifies the ShowZeroValue dependency property.
S	ThicknessProperty	Identifies the Thickness dependency property. (Inherited from **AxisBase**)
S	TickmarksCrossAxisProperty	Identifies the TickmarksCrossAxis dependency property. (Inherited from **AxisBase**)
S	TickmarksLengthProperty	Identifies the TickmarksLength dependency property. (Inherited from **AxisBase**)
S	TickmarksMinorLengthProperty	Identifies the TickmarksMinorLength dependency property. (Inherited from **AxisBase**)
S	TickmarksMinorThicknessProperty	Identifies the TickmarksMinorThickness dependency property. (Inherited from **AxisBase**)
S	TickmarksThicknessProperty	Identifies the TickmarksThickness dependency property. (Inherited from **AxisBase**)
S	TitleProperty	Identifies the Title dependency property. (Inherited from **AxisBase**)

© 2018 Developer Express Inc.

	VisibleProperty	Identifies the Visible dependency property. (Inherited from **AxisBase**)
	VisualRangeProperty	Identifies the VisualRange dependency property. (Inherited from **AxisBase**)
	WholeRangeProperty	Identifies the WholeRange dependency property. (Inherited from **AxisBase**)

ShowZeroValue Attached Property

Gets or sets a value indicating whether the Y-axis range should be automatically recalculated to make the zero level constantly visible.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic

```
See GetShowZeroValue, SetShowZeroValue
```

C#

```
See GetShowZeroValue, SetShowZeroValue
```

Property Value

true, if the zero level should be always visible; otherwise, **false**.

GetShowZeroValue Method

Gets the value of the ShowZeroValue attached property for a specified WholeAxisRange object.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetShowZeroValue(
   ByVal range As WholeAxisRange
) As Boolean
```
C#
```
public static bool GetShowZeroValue(
   WholeAxisRange range
)
```

Parameters
range
The axis range from which the property value is read.

Return Value

The ShowZeroValue property value for the axis range.

SetShowZeroValue Method

Sets the value of the ShowZeroValue attached property to a specified WholeAxisRange.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic

```
static Public Sub SetShowZeroValue(
   ByVal range As WholeAxisRange,
   ByVal value As Boolean
)
```

C#

```
public static void SetShowZeroValue(
   WholeAxisRange range,
   bool value
)
```

Parameters
range
The axis range to which the attached property is written.
value
The required System.Boolean value.

BarLabelPosition Enumeration

Lists the values used to specify the position of Bar labels.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Enum BarLabelPosition
```

C#

```
public enum BarLabelPosition
```

Members

Name	Description
Center	The label is displayed in the center of the bar.
Outside	The label is displayed outside the bar (on top for positive values, and on the bottom for negative values).

Remarks

The values listed by the **BarLabelPosition** enumeration are used to set the SideBySideBarSeriesView.LabelPosition property.

BarSeriesView Members

Represents the base class for all Bar and Column series views.

The following tables list the members exposed by the BarSeriesView type.

Public Constructors

	Name	Description
	BarSeriesView	Initializes a new instance of the BarSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BarWidth	Gets or sets the width of a bar.

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElem**

© 2018 Developer Express Inc.

		ent)
	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

BarSeriesView Constructor

Initializes a new instance of the BarSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public BarSeriesView()
```

BarSeriesView Properties

Represents the base class for all Bar and Column series views.

The following tables list the members exposed by the BarSeriesView type.

Public Constructors

	Name	Description
	BarSeriesView	Initializes a new instance of the BarSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
S	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BarWidth	Gets or sets the width of a bar.

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElem**

BarWidth Property

Gets or sets the width of a bar.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property BarWidth As Double
```

C#

```
public Double BarWidth { get; set; }
```

Property Value

A System.Double value that is the bar's width in fractions of **axis units**, where an axis unit is the distance between two major values on the axis. This value should be greater than or equal to **0**.

PointAnimation Property

Specifies the animation for data points of Bar series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property PointAnimation As BarAnimationBase
```
C#
```
public BarAnimationBase PointAnimation { get; set; }
```

Property Value

A BarAnimationBase class descendant, specifying the animation type.

RangeControlViewType Property

Gets or sets a value that specifies which view type should be used to represent the current series in a Range Control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property RangeControlViewType As RangeControlViewType
```

C#

```
public RangeControlViewType RangeControlViewType { get; set; }
```

Property Value

A RangeControlViewType object.

CartesianChart Class

The Cartesian Chart control to plot series of data points on an XY Cartesian diagram.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class CartesianChart Inherits ChartBase, IChartViewHolder,
  IRangeControlSupport
```

C#

```
public class CartesianChart : ChartBase, IChartViewHolder,
  IRangeControlSupport
```

Remarks

The **CartesianChart** class represents a visual control intended for graphical data representation. It is comprised of separate elements, such as axes, legend, etc. To learn more about them, refer to Visual Elements.

To display a Series on a chart, it's necessary to add this series to the collection returned by the ChartBase.Series property. Note that the **CartesianChart** control can display only series for which Series.View is one of the CartesianSeriesView class descendants (e.g., AreaSeriesView, SideBySideBarSeriesView, PointSeriesView, etc.).

To display series of the PieSeriesView, DonutSeriesView and NestedDonutSeriesView type, use the PieChart control instead.

For more information on using chart controls, please refer to the Concepts section.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

CartesianChart Members

The Cartesian Chart control to plot series of data points on an XY Cartesian diagram.

The following tables list the members exposed by the CartesianChart type.

Public Constructors

	Name	Description
	CartesianChart	Initializes a new instance of the CartesianChart class with default settings.

Public Properties

	Name	Description
	ActualAxisX	Gets the actual x-axis of the CartesianChart object.
	ActualAxisY	Gets the actual y-axis of the CartesianChart object.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualPalette	Gets the actual palette of a chart. (Inherited from **ChartBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowAxisXZoomScroll	Gets or sets a value indicating whether or not it is allowed to zoom and scroll data along the X-axis.
	AllowAxisYZoomScroll	Gets or sets a value indicating whether or not it is allowed to zoom and scroll data along the Y-axis.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a chart's contents. (Inherited from **ChartBase**)
	AnimateOnLoading	Gets or sets a value indicating if chart contents should be animated on chart loading. (Inherited from **ChartBase**)

© 2018 Developer Express Inc.

	AxisX	Provides access to the setting of the X-axis.
	AxisY	Provides access to the setting of the Y-axis.
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)

ActualAxisX Property

Gets the actual x-axis of the CartesianChart object.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualAxisX As AxisX
```
C#
```
public AxisX ActualAxisX { get; }
```

Property Value

An AxisX object.

ActualAxisY

© 2018 Developer Express Inc.

ActualAxisY Property

Gets the actual y-axis of the CartesianChart object.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualAxisY As AxisY
```
C#
```
public AxisY ActualAxisY { get; }
```

Property Value

An AxisY object.

AllowAxisXZoomScroll Property

Gets or sets a value indicating whether or not it is allowed to zoom and scroll data along the X-axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AllowAxisXZoomScroll As Boolean
```

C#

```
public bool AllowAxisXZoomScroll { get; set; }
```

Property Value

true, if zooming and scrolling is allowed; otherwise, **false**.

AllowAxisYZoomScroll Property

Gets or sets a value indicating whether or not it is allowed to zoom and scroll data along the Y-axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AllowAxisYZoomScroll As Boolean
```

C#

```
public bool AllowAxisYZoomScroll { get; set; }
```

Property Value

true, if zooming and scrolling is allowed; otherwise, **false**.

AxisX Property

Provides access to the setting of the X-axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AxisX As AxisX
```

C#

```
public AxisX AxisX { get; set; }
```

Property Value

An AxisX object which represents the X-axis.

Remarks

For more information on axes, see the Axis topic.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            for (int i = 1; i < count; i++) {

AxisY Property

Provides access to the setting of the Y-axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AxisY As AxisY
```

C#

```
public AxisY AxisY { get; set; }
```

Property Value

An AxisY object which represents the Y-axis.

Remarks

For more information on axes, see the Axis topic.

Rotated Property

Specifies whether or not the chart area should be rotated.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Rotated As Boolean
```

C#

```
public bool Rotated { get; set; }
```

Property Value

true, to rotate the diagram; otherwise, **false**.

Remarks

If the **Rotated** property is enabled, the X-axis is displayed vertically, and the Y-axis is displayed horizontally.

Note that the **Rotated** property doesn't affect the functionality of the axes. To clarify - the axis of arguments is still the X-axis, and the axis of values - the Y-axis.

SetAxisXRangeCommand Property

Returns a command that sets the specified range for the X-axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property SetAxisXRangeCommand As ICommand
```

C#

```
public ICommand SetAxisXRangeCommand { get; }
```

Property Value

An object that defines a command implementing the System.Windows.Input.ICommand interface.

CartesianSeriesView Members

Represents the base class for all series views that can be displayed on a CartesianChart control.

The following tables list the members exposed by the CartesianSeriesView type.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
S	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property.
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color.
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObj**

Brush Property

Gets or sets the color of the series view. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Brush As SolidColorBrush
```

C#

```
public SolidColorBrush Brush { get; set; }
```

Property Value

SolidColorBrush

See Also

CartesianSeriesView Class
CartesianSeriesView Members
DevExpress.UI.Xaml.Charts Namespace

ColorEach Property

Gets or sets a value that specifies whether each data point of a series is shown in a different color.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ColorEach As Boolean
```

C#

```
public bool ColorEach { get; set; }
```

Property Value

true to specify that each data point in a series has a different color; **false** to use the same color for all the series' data points.

Remarks

Use the **ColorEach** property to control whether chart elements which represent an individual data point (such as a bar or data point marker, for instance) are drawn in different colors. If this property is set to **true**, colors for series data points are generated automatically based upon the palette specified by the ChartBase.Palette property.

ChartBase Class

The base class for chart controls.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class ChartBase Inherits Control
```

C#

```
public abstract class ChartBase : Control
```

Remarks

The **ChartBase** class represents the base class for visual controls intended for graphical data representation.

ChartBase Members

The base class for chart controls.

The following tables list the members exposed by the ChartBase type.

Public Constructors

	Name	Description
	ChartBase	Initializes a new instance of the ChartBase class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualPalette	Gets the actual palette of a chart.
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a chart's contents.
	AnimateOnLoading	Gets or sets a value indicating if chart contents should be animated on chart loading.
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

ChartBase Constructor

Initializes a new instance of the ChartBase class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public ChartBase()
```

ChartBase Properties

The base class for chart controls.

The following tables list the members exposed by the ChartBase type.

Public Constructors

	Name	Description
	ChartBase	Initializes a new instance of the ChartBase class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualPalette	Gets the actual palette of a chart.
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a chart's contents.
	AnimateOnLoading	Gets or sets a value indicating if chart contents should be animated on chart loading.
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)

ActualPalette Property

Gets the actual palette of a chart.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualPalette As Palette
```
C#
```
public Palette ActualPalette { get; }
```

Property Value

A Palette object.

AnimateCommand Property

Returns a command that starts animation of a chart's contents.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property AnimateCommand As ICommand
```
C#
```
public ICommand AnimateCommand { get; }
```

Property Value

An object that defines a command implementing the System.Windows.Input.ICommand interface.

AnimateOnLoading Property

Gets or sets a value indicating if chart contents should be animated on chart loading.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AnimateOnLoading As Boolean
```

C#

```
public bool AnimateOnLoading { get; set; }
```

Property Value

true, to animate chart contents on loading; otherwise, **false**.

Legend Property

Gets the chart control's legend and provides access to its settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Legend As Legend
```

C#

```
public Legend Legend { get; set; }
```

Property Value

A Legend object that represents the chart control's legend.

Remarks

For more information on the chart control's legend, see the Legend object's description.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.	

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

Xaml

Palette Property

Gets or sets the palette which is used to draw the chart's series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Palette As Palette
```

C#

```
public Palette Palette { get; set; }
```

Property Value

A Palette object that is the palette with colors.

Remarks

The **Palette** property defines colors for data points. The name of the currently selected palette can be accessed via the Palette.PaletteName property. If some of the default palette colors were manually changed, you can obtain the currently used set of colors via the Palette property.

SelectionMode Property

Specifies the selection mode for chart series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property SelectionMode As ElementSelectionMode
```
C#
```
public ElementSelectionMode SelectionMode { get; set; }
```

Property Value

A ElementSelectionMode object.

Series Property

Provides access to the chart control's collection of series objects.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property Series As SeriesCollection
```

C#

```
public SeriesCollection Series { get; }
```

Property Value

A SeriesCollection object.

Remarks

Use the **Series** property to get access to the chart's collection of series. Each individual series is represented by a Series object, which contains all the information on the series data and the way to represent it.

For more information, refer to Series.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

ToolTipEnabled Property

Gets or sets a value that specifies whether or not a tooltip is enabled for a chart.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ToolTipEnabled As Boolean
```

C#

```
public bool ToolTipEnabled { get; set; }
```

Property Value

true - a tooltip is enabled for a chart; **false** - a tooltip is disabled.

Remarks

Use the **ToolTipEnabled** property to activate (deactivate) a tooltip at the level of a chart (CartesianChart or PieChart controls).

To customize the tooltip content and appearance for a specific seres or its data points, use the SeriesView.ToolTipSeriesPattern, SeriesView.ToolTipSeriesTemplate, SeriesView.ToolTipPointPattern and SeriesView.ToolTipPointTemplate properties.

SelectionChanged Event

Occurs when the chart selection is changed.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
event Public SelectionChanged As ChartElementSelectionChangedEventHandler
```

C#

```
public event ChartElementSelectionChangedEventHandler SelectionChanged
```

Event Data

The event handler receives an argument of type DevExpress.UI.Xaml.Charts.ChartElementSelectionChangedEventArgs containing data related to this event.

Animate Method

Starts animating chart series after the specified delay.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub Animate(
   ByVal delayInSeconds As Double
)
```
C#
```
public void Animate(
   Double delayInSeconds
)
```

Parameters
delayInSeconds
A System.Double value specifying the delay (in seconds).

ChartDataAdapter Class

The base class for all adapters that provide data for a series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class ChartDataAdapter Inherits ChartDependencyObject, IChartDataAdapter
```

C#

```
public abstract class ChartDataAdapter : ChartDependencyObject, IChartDataAdapter
```

Remarks

Instances of the **ChartDataAdapter** class descendants can be assigned to the Series.Data property.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();

ChartDataMemberType Enumeration

Lists the values used to specify which attribute of a data point should be populated using a data member's settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Enum ChartDataMemberType
```

C#

```
public enum ChartDataMemberType
```

Members

Name	Description
Argument	A data member specifies an argument of a data point.
Value	A data member specifies the value of a data point.

Remarks

The values listed by the **ChartDataMemberType** enumerator are used to set the DataMember.DataMemberType properties.

ChartDependencyObject Class

Enables WinRT property system services for its derived model classes.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class ChartDependencyObject Inherits DependencyObject, IOwnedElement,
  INotifyPropertyChanged
```

C#

```
public class ChartDependencyObject : DependencyObject, IOwnedElement,
  INotifyPropertyChanged
```

Remarks

For more information, refer to the Windows.UI.Xaml.DependencyObject class description in MSDN.

PropertyChanged Event

Occurs every time any of the ChartDependencyObject class properties has changed its value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
event Public PropertyChanged As PropertyChangedEventHandler
```

C#

```
public event PropertyChangedEventHandler PropertyChanged
```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event.

The following **PropertyChangedEventArgs** properties provide information specific to this event.

ChartElement Class

Represents the base class for other chart elements intended to hide most properties of the Windows.UI.Xaml.Controls.Control class.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class ChartElement Inherits Control, IOwnedElement,
  IChartElement,
  INotifyPropertyChanged
```

C#

```
public abstract class ChartElement : Control, IOwnedElement,
  IChartElement,
  INotifyPropertyChanged
```

Remarks

The **ChartElement** class serves as a base for other classes, which should be inherited from the Windows.UI.Xaml.Controls.Control class, but don't use all its properties.

Note
Instances of all **ChartElement** class descendants are always placed in the logical tree of the ChartBase control.

PropertyChanged Event

Occurs every time any of the ChartElement class properties has changed its value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
event Public PropertyChanged As PropertyChangedEventHandler
```

C#

```
public event PropertyChangedEventHandler PropertyChanged
```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event.

The following **PropertyChangedEventArgs** properties provide information specific to this event.

AddChild Method

Adds a child element to the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub AddChild(
   ByVal element As IOwnedElement
)
```
C#
```
public void AddChild(
   IOwnedElement element
)
```

Parameters
element
An object implementing the **IOwnedElement** interface.

RemoveChild Method

Removes the child element from this collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub RemoveChild(
   ByVal element As IOwnedElement
)
```
C#
```
public void RemoveChild(
   IOwnedElement element
)
```

Parameters
element
An object implementing the **IOwnedElement** interface.

ContourAppearance Class

Contains settings that specify the appearance of a contour drawn around chart elements.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class ContourAppearance Inherits ChartDependencyObject
```

C#

```
public class ContourAppearance : ChartDependencyObject
```

Remarks

The **ContourAppearance** class provides the Brush property that specifies border color and the StrokeStyle property that specifies the appearance of a border line. Instances of the **ContourAppearance** class can be accessed via the **ContourAppearance** property of various classes (e.g., AreaSeriesView.ContourAppearance, PieSeriesView.ContourAppearance, etc.).

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.__ComObject
      System.Runtime.InteropServices.WindowsRuntime.RuntimeClass

DataChangingAnimationMode Enumeration

Lists the values used to specify how data points are animated when the underlying data is changed.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Enum DataChangingAnimationMode
```

C#

```
public enum DataChangingAnimationMode
```

Members

Name	Description
AnimateEntireSeries	The entire series is animated if even a single data point has been changed.
Disabled	A series isn't animated when its data points are changing.

Remarks

The values listed by the **DataChangingAnimationMode** enumerator are used to set the SeriesView.DataChangingAnimationMode properties.

See Also

DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

DataMember Class

Contains data member settings that specify from which column in a datasource to obtain data for data points, as well as how to treat this data.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataMember Inherits Object, INotifyPropertyChanged
```

C#

```
public class DataMember : object, INotifyPropertyChanged
```

Remarks

The **DataMember** class introduces the following properties:

- ColumnName, which specifies from which column in a datasource to obtain data;
- DataMemberType, which specifies for which data point attribute (argument or value) this data will be obtained;
- ScaleType, which specifies how to treat this data (as numbers, data-time values or as strings).

Instances of the **DataMember** class are available in the DataMemberCollection returned by the DataSourceAdapter.DataMembers property.

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }

DataMember Members

Contains data member settings that specify from which column in a datasource to obtain data for data points, as well as how to treat this data.

The following tables list the members exposed by the DataMember type.

Public Constructors

	Name	Description
	DataMember	Overloaded. Initializes a new instance of the DataMember class with the data member type and a name of the column from a datasource.

Public Properties

	Name	Description
	ColumnName	Specifies the name of a column in a datasource, from which to obtain data for a series.
	DataMemberType	Specifies the type of a data member.
	ScaleType	Specifies the scale type of data in a column.

Public Methods

	Name	Description
	Equals	(Inherited from **System.Object**)
	Equals	(Inherited from **System.Object**)
	GetHashCode	(Inherited from **System.Object**)
	GetType	(Inherited from **System.Object**)
	ReferenceEquals	(Inherited from **System.Object**)
	ToString	(Inherited from **System.Object**)

Public Events

	Name	Description
	PropertyChanged	Occurs every time any of the DataMember class properties has changed its value.

DataMember Constructor (ChartDataMemberType, string)

Initializes a new instance of the DataMember class with the data member type and a name of the column from a datasource.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New(
   ByVal dataMemberType As ChartDataMemberType,
   ByVal columnName As String
)
```
C#
```
public DataMember(
   ChartDataMemberType dataMemberType,
   string columnName
)
```

Parameters
dataMemberType
A ChartDataMemberType enumeration value specifying the data member type. This value is assigned to the DataMemberType property.
columnName
A System.String value specifying the column name. This value is assigned to the ColumnName property.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {

ScaleType Property

Specifies the scale type of data in a column.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ScaleType As ScaleType
```

C#

```
public ScaleType ScaleType { get; set; }
```

Property Value

A ScaleType object.

Remarks

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

DataMember Events

Contains data member settings that specify from which column in a datasource to obtain data for data points, as well as how to treat this data.

The following tables list the members exposed by the DataMember type.

Public Events

	Name	Description
	PropertyChanged	Occurs every time any of the DataMember class properties has changed its value.

PropertyChanged Event

Occurs every time any of the DataMember class properties has changed its value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
event Public PropertyChanged As PropertyChangedEventHandler
```

C#

```
public event PropertyChangedEventHandler PropertyChanged
```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event.

The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName

DataMemberCollection Class

Represents a collection that stores the data members of a particular DataSourceAdapter.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataMemberCollection Inherits BaseObservableCollection(of DataMember)
```

C#

```
public class DataMemberCollection : BaseObservableCollection<DataMember>
```

Remarks

An object of the **DataMemberCollection** type is returned by the DataSourceAdapter.DataMembers property.

DataMemberCollection Constructor

Initializes a new instance of the DataMemberCollection class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public DataMemberCollection()
```

See Also
DataMemberCollection Class
DataMemberCollection Members

DataPoint Class

An individual data point in the series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataPoint Inherits Object, INotifyPropertyChanged
```

C#

```
public class DataPoint : object, INotifyPropertyChanged
```

Remarks

The **DataPoint** class implements the functionality of an individual data point in a series. Each point has two coordinates.

- **X-coordinate** (the point's *argument*).

Specified via the Argument or property, and depends on the scale type assigned to the ArgumentScaleType property.

- **Y-coordinate** (the point's *value*).

Specified via the Value property, and depends on the scale type assigned to the ValueScaleType property.

Note
If a point is missing the argument or value implied by the series view and scale type, it is considered *empty*, meaning that it isn't drawn on the diagram, leaving a gap in the series data.

Points of a single series are stored within its Series.Data collection (represented by an instance of the DataPointCollection class). The collection provides the standard means for manipulating its items (such as adding, removing and accessing them), and each data point in it is available via the **Item** property of the collection, using indexer notation.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4239.	

The following example demonstrates how to create a simple Pie Chart with one series.

Xaml

DataPoint Constructor

Initializes a new instance of the DataPoint class with default settings.

Overload List

Name	Description
DataPoint()	Initializes a new instance of the DataPoint class with default settings.
DataPoint(DateTime argument)	Initializes a new instance of the DataPoint class with the specified date-time argument.
DataPoint(string argument)	Initializes a new instance of the DataPoint class with the specified qualitative argument.
DataPoint(Double argument)	Initializes a new instance of the DataPoint class with the specified numerical argument.
DataPoint(DateTime argument, DateTime value)	Initializes a new instance of the DataPoint class with the specified date-time argument and value.
DataPoint(string argument, DateTime value)	Initializes a new instance of the DataPoint class with the specified qualitative argument and date-time value.
DataPoint(string argument, Double value)	Initializes a new instance of the DataPoint class with the specified qualitative argument and numerical value.
DataPoint(Double argument, DateTime value)	Initializes a new instance of the DataPoint class with the specified numerical argument and date-time value.
DataPoint(DateTime argument, Double value)	Initializes a new instance of the DataPoint class with the specified date-time argument and numerical value.
DataPoint(Double argument, Double value)	Initializes a new instance of the DataPoint class with the specified numerical argument and value.

DataPoint Constructor

Initializes a new instance of the DataPoint class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public New()
```

C#

```
public DataPoint()
```

Remarks

This constructor is intended for serialization purposes only. Normally, you don't need to use it.

Instead, use one of the other methods available in the DataPoint's overload list of constructors.

DataPoint Constructor (DateTime)

Initializes a new instance of the DataPoint class with the specified date-time argument.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal argument As DateTime
)
```

C#

```
public DataPoint(
   DateTime argument
)
```

Parameters

argument
A System.DateTime value which specifies the date-time argument of the series point. This value is assigned to the DateTimeArgument property.

Remarks

Note that this constructor creates an *empty point* (which is also known as a *missing point*) with the empty Value. This point will either be skipped, or generate a break when painting its owner series, depending upon the current series view.

DataPoint Constructor (string)

Initializes a new instance of the DataPoint class with the specified qualitative argument.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal argument As String
)
```

C#

```
public DataPoint(
   string argument
)
```

Parameters

argument
A System.String value which specifies the qualitative argument of the series point. This value is assigned to the Argument property.

Remarks

Note that this constructor creates an *empty point* (which is also known as a *missing point*) with the empty Value. This point will either be skipped, or generate a break when painting its owner series, depending upon the current series view.

DataPoint Constructor (Double)

Initializes a new instance of the DataPoint class with the specified numerical argument.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public New(
   ByVal argument As Double
)
```

C#

```
public DataPoint(
   Double argument
)
```

Parameters

argument
A System.Double value which specifies the numerical argument of the series point. This value is assigned to the NumericalArgument property.

Remarks

Note that this constructor creates an *empty point* (which is also known as a *missing point*) with the empty Value. This point will either be skipped, or generate a break when painting its owner series, depending upon the current series view.

ArgumentScaleType Property

Specifies the scale type of a data point's argument.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property ArgumentScaleType As ScaleType
```

C#

```
public ScaleType ArgumentScaleType { get; }
```

Property Value

A ScaleType enumeration value.

Remarks

For more information, refer to Providing Data.

See Also

DateTimeArgument Property

Gets the point's argument value of a date-time type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property DateTimeArgument As DateTime
```

C#

```
public DateTime DateTimeArgument { get; }
```

Property Value

A System.DateTime value that represents the date-time argument of the series data point.

Remarks

This property returns the object, stored by the Argument property, converted to a System.DateTime type. Note that the **DateTimeArgument** property is in effect only when the ArgumentScaleType is ScaleType.DateTime.

DateTimeValue Property

Gets the point's value of a date-time type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property DateTimeValue As DateTime
```

C#

```
public DateTime DateTimeValue { get; }
```

Property Value

A System.DateTime value that represents the date-time value of the series data point.

Remarks

This property returns the object, stored by the Value property, converted to a System.DateTime type. Note that the **DateTimeValue** property is in effect only when the ValueScaleType is ScaleType.DateTime.

NumericalArgument Property

Gets the point's argument value of a numerical type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property NumericalArgument As Double
```

C#

```
public Double NumericalArgument { get; }
```

Property Value

A System.Double value that represents the numerical argument of the series data point.

Remarks

This property returns the object, stored by the Argument property, converted to a System.Double type. Note that the **NumericalArgument** property is in effect only when the ArgumentScaleType is ScaleType.Numerical.

NumericalValue Property

A numerical value of a data point.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property NumericalValue As Double
```

C#

```
public Double NumericalValue { get; }
```

Property Value

A Double object.

Remarks

For more information, refer to Providing Data.

QualitativeArgument Property

A qualitative argument of a data point.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property QualitativeArgument As String
```

C#

```
public string QualitativeArgument { get; }
```

Property Value

A String object.

Remarks

For more information, refer to Providing Data.

Value Property

Gets or sets the point's data value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Value As Object
```

C#

```
public object Value { get; set; }
```

Property Value

A Object object.

Remarks

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

ValueScaleType Property

Specifies the scale type of a data point value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property ValueScaleType As ScaleType
```

C#

```
public ScaleType ValueScaleType { get; }
```

Property Value

A ScaleType object.

Remarks

For more information, refer to Providing Data.

DataPointCollection
Data Scale Types

© 2018 Developer Express Inc.

PropertyChanged Event

Occurs when any of the DataPoint class properties has changed its value.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
event Public PropertyChanged As PropertyChangedEventHandler
```

C#

```
public event PropertyChangedEventHandler PropertyChanged
```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event.

The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName

DataPointCollection Class

Provides a collection of data points for a series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataPointCollection Inherits ChartDataAdapter
```

C#

```
public class DataPointCollection : ChartDataAdapter
```

Remarks

To provide data for a Series, it's necessary to specify one of the ChartDataAdapter class descendants to the Series.Data property. There are two ways of doing this:

- **Explicitly add all data points to the series**.
  To do this, assign the **DataPointCollection** object to the **Series.Data** property and add all data points to the Points collection.
- **Populate a series with data from a datasource**.
  To do this, assign the DataSourceAdapter object to the **Series.Data** property and specify its settings, such as DataSourceAdapter.DataSource and DataSourceAdapter.DataMembers.

For more information, refer to Providing Data.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4239.	

The following example demonstrates how to create a simple Pie Chart with one series.

Xaml

DataPointCollection Members

Provides a collection of data points for a series.

The following tables list the members exposed by the DataPointCollection type.

Public Constructors

	Name	Description
	DataPointCollection	Initializes a new instance of the DataPointCollection class with default settings.

Public Properties

	Name	Description
	ActualArgumentScaleType	Gets the actual argument scale type.
	ActualValueScaleType	Gets the actual value scale type.
	ArgumentScaleType	Specifies the scale type of data points arguments.
	Count	Gets the number of elements contained in the DataPointCollection instance.
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Item	Provides indexed access to individual items in the collection.
	Points	Provides access to the data points contained in this collection.
	ValueScaleType	Specifies the scale type of data point values.

Public Methods

	Name	Description
	Add	Appends the specified item to the current collection.
	Clear	Removes all items from the collection.
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Contains	Returns whether the collection contains the specified data point.
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)
	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)

© 2018 Developer Express Inc.

	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
	GetObjectByKey	Returns a data point corresponding to the specified key.
	GetType	(Inherited from **System.Object**)
	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	IndexOf	Returns the specified point's position within the collection.
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	Insert	Adds the specified data point to the specified position within the collection.
	Move	Moves the data point to another position within the collection.
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Remove	Removes the specified item from the collection.
	RemoveAt	Removes an item at the specified position from the collection.
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Public Events

	Name	Description

© 2018 Developer Express Inc.

	PropertyChanged	Occurs every time any of the DataPointCollection class properties has changed its value. (Inherited from **ChartDependencyObject**)

Specifies the scale type of data points arguments.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ArgumentScaleType As ScaleType
```

C#

```
public ScaleType ArgumentScaleType { get; set; }
```

Property Value

A ScaleType enumeration value.

Remarks

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

Count Property

Gets the number of elements contained in the DataPointCollection instance.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property Count As Integer
```
C#
```
public int Count { get; }
```

Property Value

An integer value representing the number of elements contained in the collection.

See Also
DataPointCollection Class
DataPointCollection Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

Item Property

Provides indexed access to individual items in the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Item(
   ByVal index As Integer
) As DataPoint
```

C#

```
public DataPoint this[
   int index
] { get; set; }
```

Parameters

index
A zero-based integer specifying the desired item's position within the collection. If it's negative or exceeds the last available index, an exception is raised.

Property Value

A DataPoint object which represents an item at the specified position.

Remarks

Use this property to access items using index notation.

Points Property

Provides access to the data points contained in this collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property Points As DataPoints
```

C#

```
public DataPoints Points { get; }
```

Property Value

A DataPoints object.

Remarks

For more information, refer to Providing Data.

ValueScaleType Property

Specifies the scale type of data point values.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ValueScaleType As ScaleType
```

C#

```
public ScaleType ValueScaleType { get; set; }
```

Property Value

A ScaleType object.

Remarks

For more information, refer to Providing Data.

DataPointCollection Methods

Provides a collection of data points for a series.

The following tables list the members exposed by the DataPointCollection type.

Public Methods

	Name	Description
	Add	Appends the specified item to the current collection.
	Clear	Removes all items from the collection.
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Contains	Returns whether the collection contains the specified data point.
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)
	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
S	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
	GetObjectByKey	Returns a data point corresponding to the specified key.
	GetType	(Inherited from **System.Object**)
	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	IndexOf	Returns the specified point's position within the collection.
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	Insert	Adds the specified data point to the specified position within the collection.
	Move	Moves the data point to another position within the collection.
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)

© 2018 Developer Express Inc.

	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	Remove	Removes the specified item from the collection.
	RemoveAt	Removes an item at the specified position from the collection.
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Add Method

Appends the specified item to the current collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Sub Add(
   ByVal point As DataPoint
)
```

C#

```
public void Add(
   DataPoint point
)
```

Parameters

point
An object to append to the collection.

Remarks

This method adds a new item to the end of the collection.

See Also

DataPointCollection Class
DataPointCollection Members
DevExpress.UI.Xaml.Charts Namespace

Clear Method

Removes all items from the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Sub Clear()
```
C#
```
public void Clear()
```

Remarks

Use the **Clear** method to simultaneously remove all items from the collection or the Remove and RemoveAt methods to exclude an individual item from the collection.

Contains Method

Returns whether the collection contains the specified data point.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Function Contains(
   ByVal point As DataPoint
) As Boolean
```
C#
```
public bool Contains(
   DataPoint point
)
```

Parameters
point
A DataPoint object to be checked.

Return Value

true, if the collection contains the specified data point; otherwise, **false**.

GetObjectByKey Method

Returns a data point corresponding to the specified key.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Function GetObjectByKey(
   ByVal key As Integer
) As DataPoint
```

C#

```
public DataPoint GetObjectByKey(
   int key
)
```

Parameters

key
An integer value representing the key.

Return Value

A DataPoint object, which corresponds to the specified key.

IndexOf Method

Returns the specified point's position within the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Function IndexOf(
   ByVal point As DataPoint
) As Integer
```

C#

```
public int IndexOf(
   DataPoint point
)
```

Parameters

point
A DataPoint object to locate in the collection.

Return Value

A zero-based integer representing the column's position within the collection. **-1** if the column doesn't belong to the collection.

See Also

DataPointCollection Class
DataPointCollection Members

© 2018 Developer Express Inc.

Insert Method

Adds the specified data point to the specified position within the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Sub Insert(
   ByVal index As Integer,
   ByVal point As DataPoint
)
```

C#

```
public void Insert(
   int index,
   DataPoint point
)
```

Parameters

index
An integer value representing the zero-based index at which the specified data point should be inserted. If negative or it exceeds the number of elements, an exception is raised.
point
A DataPoint object representing the data point to be inserted.

See Also

DataPointCollection Class

Move Method

Moves the data point to another position within the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Sub Move(
   ByVal oldIndex As Integer,
   ByVal newIndex As Integer
)
```

C#

```
public void Move(
   int oldIndex,
   int newIndex
)
```

Parameters

oldIndex
A zero-based integer specifying the position at which the point is currently located within the collection.
newIndex
A zero-based integer specifying the position within the collection to move the point to.

See Also

DataPointCollection Class
DataPointCollection Members

Remove Method

Removes the specified item from the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Function Remove(
   ByVal point As DataPoint
) As Boolean
```

C#

```
public bool Remove(
   DataPoint point
)
```

Parameters

point
An item to be removed from the collection.

Return Value

true if the specified item was found and successfully removed from the collection; **false** if the specified item wasn't found.

Remarks

When an item is removed from the collection, all subsequent fields are moved up one position in the collection.

See Also

DataPointCollection Class
DataPointCollection Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

RemoveAt Method

Removes an item at the specified position from the collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Sub RemoveAt(
   ByVal index As Integer
)
```

C#

```
public void RemoveAt(
   int index
)
```

Parameters

index
A zero-based integer specifying the index of the object to remove. If it's negative or exceeds the number of elements, an exception is raised.

Remarks

Use the Remove and **RemoveAt** methods to remove specified items from the collection. All items that follow that item are then moved up to fill the vacant position. The indexes of the moved items are also updated. The Clear method can be used to clear the collection.

DataPoints Class

A collection of DataPoint objects.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataPoints Inherits BaseObservableCollection(of DataPoint)
```

C#

```
public class DataPoints : BaseObservableCollection<DataPoint>
```

Remarks

An instance of the **DataPoints** type is returned by the DataPointCollection.Points property.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

DataPoints Constructor

Initializes a new instance of the DataPoints class with the specified owner collection.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New(
   ByVal collection As DataPointCollection
)
```
C#
```
public DataPoints(
   DataPointCollection collection
)
```

Parameters
collection
A DataPointCollection object which is the owner of the created DataPoints instance.

See Also

DataPoints Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

DataSourceAdapter Class

Contains data binding settings that define the datasource to obtain data for a series, as well as data fields to be used from this datasource.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class DataSourceAdapter Inherits ChartDataAdapter, IDisposable
```

C#

```
public class DataSourceAdapter : ChartDataAdapter, IDisposable
```

Remarks

To provide data for a Series, it's necessary to specify one of the ChartDataAdapter class descendants to the Series.Data property. There are two ways of doing this:

- **Explicitly add all data points to the series**.
  To do this, assign the DataPointCollection object to the **Series.Data** property and add all data points to the DataPointCollection.Points collection.
- **Populate a series with data from a datasource**.
  To do this, assign the **DataSourceAdapter** object to the **Series.Data** property and specify its settings, such as DataSource and DataMembers.

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {

DataSourceAdapter Members

Contains data binding settings that define the datasource to obtain data for a series, as well as data fields to be used from this datasource.

The following tables list the members exposed by the DataSourceAdapter type.

Public Constructors

	Name	Description
	DataSourceAdapter	Overloaded. Initializes a new instance of the DataSourceAdapter class with the specified datasource.

Public Properties

	Name	Description
	DataMembers	Provides access to the collection of data members.
	DataSource	Specifies the datasource from which to obtain data for a series.
	Dispatcher	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Public Methods

	Name	Description
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)
	Dispose	Disposes the DataSourceAdapter object.
	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
S	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
	GetObjectByKey	Returns an object corresponding to the specified key.
	GetType	(Inherited from **System.Object**)

© 2018 Developer Express Inc.

	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	UnregisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)

Public Fields

	Name	Description
S	DataSourceProperty	Identifies the DataSource dependency property.

Public Events

	Name	Description
	PropertyChanged	Occurs every time any of the DataSourceAdapter class properties has changed its value. (Inherited from **ChartDependencyObject**)

DataSourceAdapter Constructor

Initializes a new instance of the DataSourceAdapter class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public DataSourceAdapter()
```

DataSourceAdapter Constructor (object)

Initializes a new instance of the DataSourceAdapter class with the specified datasource.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New(
   ByVal dataSource As Object
)
```
C#
```
public DataSourceAdapter(
   object dataSource
)
```

Parameters
dataSource
A System.Object specifying the datasource. This value is assigned to the DataSource property.

DataMembers Property

Provides access to the collection of data members.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public ReadOnly Property DataMembers As DataMemberCollection
```

C#

```
public DataMemberCollection DataMembers { get; }
```

Property Value

A DataMemberCollection object.

Remarks

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

© 2018 Developer Express Inc.

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }

DataSourceAdapter Class
DataSourceAdapter Members
DevExpress.UI.Xaml.Charts Namespace

© 2018 Developer Express Inc.

DataSource Property

Specifies the datasource from which to obtain data for a series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property DataSource As Object
```

C#

```
public object DataSource { get; set; }
```

Property Value

Object

Remarks

For more information, refer to Providing Data.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Series.Data property and specify the datasource for the adapter via its DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

```
 (ViewModel.cs)
using System;
using System.Collections;
using System.Collections.Generic;
namespace BindChart {
    public class DateTimeDataPoint {
        public DateTime PointArgument { get; set; }
        public double PointValue { get; set; }
    }
    public class ViewModel {
        DateTime start = new DateTime(2000, 1, 1);
        IEnumerable itemsSource;
        readonly Random random = new Random();
        public TimeSpan Step { get; set; }
        public int Count { get; set; }
        public double Start { get; set; }
        public IEnumerable ItemsSource {
            get { return itemsSource ?? (itemsSource = CreateItemsSource(Count)); }
        }
        protected IEnumerable CreateItemsSource(int count) {
            var points = new List<DateTimeDataPoint>();
            double value = GenerateStartValue(random);
            points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            for (int i = 1; i < count; i++) {
                value += GenerateAddition(random);
                start = start + Step;
                points.Add(new DateTimeDataPoint() { PointArgument = start, PointValue = value });
            }
            return points;
        }
        protected double GenerateStartValue(Random random) {
            return Start + random.NextDouble() * 100;
        }
        protected double GenerateAddition(Random random) {
            double factor = random.NextDouble();
            if (factor == 1)
                factor = 50;
            else if (factor == 0)
                factor = -50;
            return (factor - 0.5) * 50;
        }
    }
}
```

DataSourceAdapter Methods

Contains data binding settings that define the datasource to obtain data for a series, as well as data fields to be used from this datasource.

The following tables list the members exposed by the DataSourceAdapter type.

Public Methods

	Name	Description
	ClearValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	CreateObjRef	(Inherited from **System.MarshalByRefObject**)
	Dispose	Disposes the DataSourceAdapter object.
	Equals	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
S	Equals	(Inherited from **System.Object**)
	GetAnimationBaseValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	GetHashCode	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)
	GetLifetimeService	(Inherited from **System.MarshalByRefObject**)
	GetObjectByKey	Returns an object corresponding to the specified key.
	GetType	(Inherited from **System.Object**)
	GetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	InitializeLifetimeService	(Inherited from **System.MarshalByRefObject**)
	ReadLocalValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
S	ReferenceEquals	(Inherited from **System.Object**)
	RegisterPropertyChangedCallback	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	SetValue	(Inherited from **Windows.UI.Xaml.DependencyObject**)
	ToString	(Inherited from **System.Runtime.InteropServices.WindowsRuntime.RuntimeClass**)

Dispose Method

Disposes the DataSourceAdapter object.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Sub Dispose()
```

C#

```
public void Dispose()
```

Remarks

Call the **Dispose** method when you have finished working with a manually created DataSourceAdapter object. This releases all the resources allocated to the object and speeds up system performance.

GetObjectByKey Method

Returns an object corresponding to the specified key.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Function GetObjectByKey(
   ByVal key As Integer
) As Object
```
C#
```
public object GetObjectByKey(
   int key
)
```

Parameters
key
An integer value representing the key.

Return Value

An Object, which corresponds to the specified key.

DateTimeMeasureUnit Enumeration

Lists the values that specify the unit of measurement for date-time values within a chart control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum DateTimeMeasureUnit
```
C#
```
public enum DateTimeMeasureUnit
```

Members

Name	Description
Day	Specifies a day as the measurement unit for date-time values.
Hour	Specifies an hour as the measurement unit for date-time values.
Millisecond	Specifies a millisecond as the measurement unit for date-time values.
Minute	Specifies a minute as the measurement unit for date-time values.
Month	Specifies a month as the measurement unit for date-time values.
Quarter	Specifies a quarter of a year as the measurement unit for date-time values.
Second	Specifies a second as the measurement unit for date-time values.
Week	Specifies a week as the measurement unit for date-time values.
Year	Specifies a year as the measurement unit for date-time values.

Remarks

The values listed by this enumeration are used to set the AxisBase.DateTimeMeasureUnit and AxisBase.DateTimeGridAlignment properties.

Example

```

C#

```
public class DonutSeriesView : PieSeriesView
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the Donut type, refer to the Donut document.

DonutSeriesView Members

Represents a series view of the Donut type.

The following tables list the members exposed by the DonutSeriesView type.

Public Constructors

	Name	Description
	DonutSeriesView	Initializes a new instance of the DonutSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance. (Inherited from **PieSeriesView**)
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ContourAppearance	Gets or sets the appearance of a pie contour. (Inherited from **PieSeriesView**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

S	IsEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsHitTestVisible	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	IsHitTestVisibleProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsHoldingEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsRightTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTabStop	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTabStopProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTapEnabled	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTapEnabledProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	IsTemplateFocusTargetProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTextScaleFactorEnabled	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	IsTextScaleFactorEnabledProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	KeyDownEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	KeyUpEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	LabelOptions	Provides access to the settings of series labels. (Inherited from **SeriesView**)
	LabelPosition	Gets or sets the label's position in reference to the pie series point's slice. (Inherited from **PieSeriesView**)
	Language	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	LanguageProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	LegendItems	Gets a list of legend items for this series. (Inherited from **SeriesView**)
	LegendMarkerTemplate	Gets or sets the template that defines the presentation of a legend marker

© 2018 Developer Express Inc.

		for this series. (Inherited from **SeriesView**)
	LegendPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within legend items. (Inherited from **SeriesView**)
	LegendPointPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within legend items. (Inherited from **SeriesView**)
	ManipulationCompletedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationDeltaEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationInertiaStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationStartedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	ManipulationStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Margin	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MarginProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinWidth	(Inherited from **Windows.UI.Xaml.FrameworkElem**

	PointerPressedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerReleasedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	PointerWheelChangedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	SelectedItem	Gets or sets the currently selected item in the series. (Inherited from **SeriesView**)
	SelectedItemBrush	Gets or sets the color of the selected series point. (Inherited from **SeriesView**)
	SelectedItems	Gets or sets the collection of selected items of the DonutSeriesView object. (Inherited from **SeriesView**)
	SeriesAnimation	Provides access to the settings of a series animation. (Inherited from **PieSeriesView**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this series. (Inherited from **SeriesView**)
	ShowToolTipOnSelectItem	Gets or sets a value specifying whether or not to show a tooltip every time a series (or a series point) is selected. (Inherited from **SeriesView**)
	StartAngle	Specifies the starting angle to draw pie series slices. (Inherited from **PieSeriesView**)

© 2018 Developer Express Inc.

	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	SweepDirection	Specifies the direction in which a Pie series is swept. This is a dependency property. (Inherited from **PieSeriesView**)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Title	Provides access to the title settings of the pie. (Inherited from **PieSeriesView**)
	ToolTipPointPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within a tooltip that appears for a series point. (Inherited from **SeriesView**)
	ToolTipPointTemplate	Specifies the tooltip template for this series. This is a dependency property. (Inherited from **SeriesView**)
	ToolTipSeriesPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within the tooltip that appears for a series. (Inherited from **SeriesView**)

© 2018 Developer Express Inc.

	ToolTipSeriesTemplate	Gets or sets the template that defines the presentation of the tooltip for this series. (Inherited from **SeriesView**)
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)
S	TransitionsProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Triggers	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	UseLayoutRounding	(Inherited from **Windows.UI.Xaml.UIElement**)
S	UseLayoutRoundingProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	UseSystemFocusVisuals	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	UseSystemFocusVisualsProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	VerticalAlignment	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	VerticalAlignmentProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	VerticalContentAlignment	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	VerticalContentAlignmentProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Visibility	(Inherited from **Windows.UI.Xaml.UIElement**)
S	VisibilityProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Width	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	WidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

Public Methods

	Name	Description

© 2018 Developer Express Inc.

	AddHandler	(Inherited from **Windows.UI.Xaml.UIElement**)
	Animate	Starts animating the series view after the specified delay. (Inherited from **SeriesView**)
	ApplyTemplate	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Arrange	(Inherited from **Windows.UI.Xaml.UIElement**)
	CancelDirectManipulations	(Inherited from **Windows.UI.Xaml.UIElement**)

HoleRadiusPercent Property

Gets or sets the radius of the inner circle in donut series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property HoleRadiusPercent As Integer
```
C#
```
public int HoleRadiusPercent { get; set; }
```

Property Value

An integer value, representing the percentage of the inner radius to the outer radius of a donut.

FullStackedAreaSeriesView Class

Represents a series view of the Full-Stacked Area type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class FullStackedAreaSeriesView Inherits StackedAreaSeriesView, ISupportPercentValue
```

C#

```
public class FullStackedAreaSeriesView : StackedAreaSeriesView, ISupportPercentValue
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the Full-Stacked Area type, refer to the Full-Stacked Area document.

FullStackedAreaSeriesView Members

Represents a series view of the Full-Stacked Area type.

The following tables list the members exposed by the FullStackedAreaSeriesView type.

Public Constructors

	Name	Description
	FullStackedAreaSeriesView	Initializes a new instance of the FullStackedAreaSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance. (Inherited from **StackedAreaSeriesView**)
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ContourAppearance	Gets or sets the appearance of an area contour. (Inherited from

© 2018 Developer Express Inc.

		StackedAreaSeriesView)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	DesiredSize	(Inherited from **Windows.UI.Xaml.UIElement**)

FullStackedAreaSeriesView Constructor

Initializes a new instance of the FullStackedAreaSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public FullStackedAreaSeriesView()
```

FullStackedBarSeriesView Class

Represents a series view of the Full-Stacked Bar type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class FullStackedBarSeriesView Inherits StackedBarSeriesView, ISupportPercentValue
```

C#

```
public class FullStackedBarSeriesView : StackedBarSeriesView, ISupportPercentValue
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the Full-Stacked Bar type, refer to the Stacked Bar document.

FullStackedBarSeriesView Members

Represents a series view of the Full-Stacked Bar type.

The following tables list the members exposed by the FullStackedBarSeriesView type.

Public Constructors

	Name	Description
	FullStackedBarSeriesView	Initializes a new instance of the FullStackedBarSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BarWidth	Gets or sets the width of a bar. (Inherited from **BarSeriesView**)

© 2018 Developer Express Inc.

	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
S	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElem**

FullStackedBarSeriesView Constructor

Initializes a new instance of the FullStackedBarSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public FullStackedBarSeriesView()
```

FullStackedLineSeriesView Class

Represents a series view of the Full-Stacked Line type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class FullStackedLineSeriesView Inherits StackedLineSeriesView
```

C#

```
public class FullStackedLineSeriesView : StackedLineSeriesView
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the Full-Stacked Line type, refer to the Full-Stacked Line document.

FullStackedLineSeriesView Members

Represents a series view of the Full-Stacked Line type.

The following tables list the members exposed by the FullStackedLineSeriesView type.

Public Constructors

	Name	Description
	FullStackedLineSeriesView	Initializes a new instance of the FullStackedLineSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualStrokeStyle	Gets the actual stroke style of a scatter line. (Inherited from **ScatterLineSeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited

FullStackedLineSeriesView Constructor

Initializes a new instance of the FullStackedLineSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public FullStackedLineSeriesView()
```

FunnelChart Class

The Funnel Chart control is used to plot series of data points on a funnel chart area.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class FunnelChart Inherits ChartBase, IChartViewHolder
```

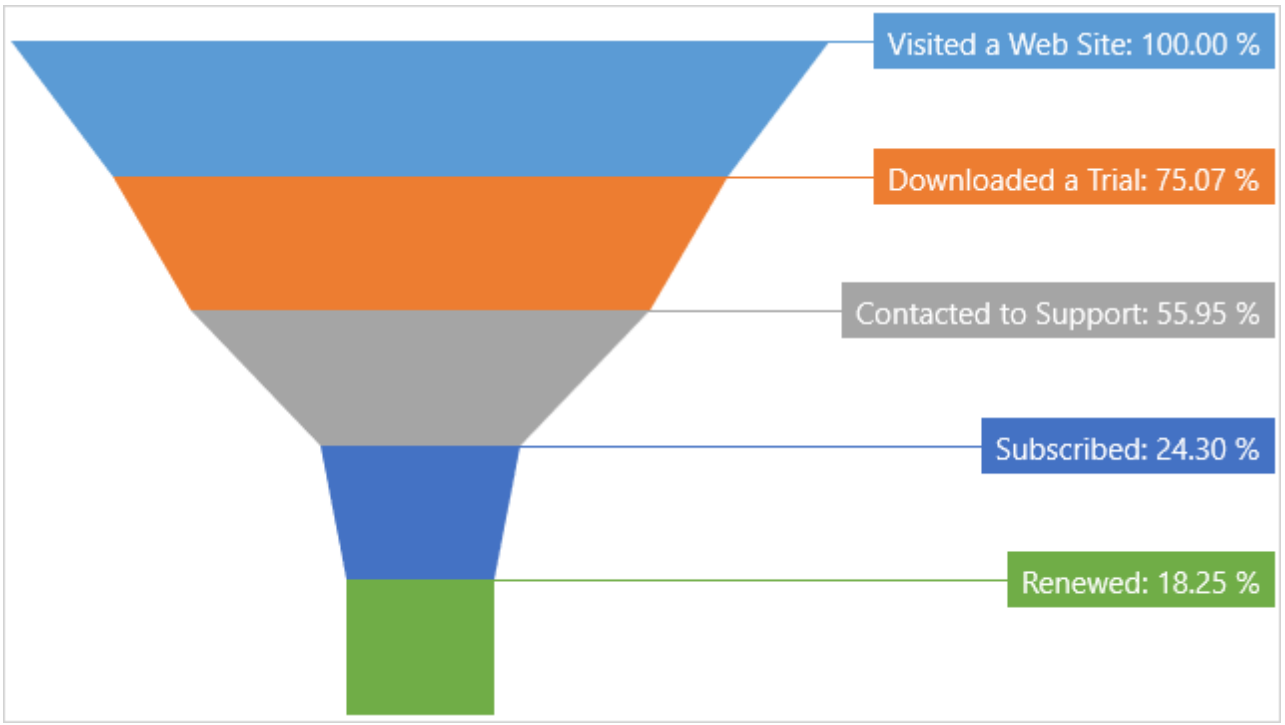
C#

```
public class FunnelChart : ChartBase, IChartViewHolder
```

Remarks

The **FunnelChart** class represents a visual control intended for graphical data representation. It is comprised of separate elements, (e.g., legend). To learn more about other visual elements, refer to Visual Elements.

The **Funnel** chart is shown in the image below.



To display a Series on a chart, it's necessary to add this series to the collection returned by the ChartBase.Series property. Note that the **FunnelChart** control can display only series for which the Series.View is the FunnelSeriesView object.

For more information on using chart controls, please refer to the Concepts section.

Example

Show Me	
A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T179113.	

This example demonstrates how to create a Funnel Chart and customize its common settings.

FunnelChart Members

The Funnel Chart control is used to plot series of data points on a funnel chart area.

The following tables list the members exposed by the FunnelChart type.

Public Constructors

	Name	Description
	FunnelChart	Initializes a new instance of the FunnelChart class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualPalette	Gets the actual palette of a chart. (Inherited from **ChartBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a chart's contents. (Inherited from **ChartBase**)
	AnimateOnLoading	Gets or sets a value indicating if chart contents should be animated on chart loading. (Inherited from **ChartBase**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

FunnelChart Constructor

Initializes a new instance of the FunnelChart class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public FunnelChart()
```

FunnelChart Properties

The Funnel Chart control is used to plot series of data points on a funnel chart area.

The following tables list the members exposed by the FunnelChart type.

Public Constructors

	Name	Description
	FunnelChart	Initializes a new instance of the FunnelChart class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualPalette	Gets the actual palette of a chart. (Inherited from **ChartBase**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a chart's contents. (Inherited from **ChartBase**)
	AnimateOnLoading	Gets or sets a value indicating if chart contents should be animated on chart loading. (Inherited from **ChartBase**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

MinIndentBetweenSeries Property

Gets or sets the minimum indent between two Funnel series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property MinIndentBetweenSeries As Integer
```

C#

```
public int MinIndentBetweenSeries { get; set; }
```

Property Value

An integer value that specifies the minimum series indent, in pixels.

Remarks

The following table illustrates how the **MinIndentBetweenSeries** property works.

MinIndentBetweenSeries =25	MinIndentBetweenSeries=75

FunnelLabelPosition Enumeration

Lists the values used to specify the position of funnel labels.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum FunnelLabelPosition
```
C#
```
public enum FunnelLabelPosition
```

Members

Name	Description
Center	The labels are displayed in the center of the funnel data points.
Left	The labels are displayed to the left of the funnel data points.
LeftColumn	The labels are organized into a straight column to the left of the funnel data points.
Right	The labels are displayed to the right of the funnel data points.
RightColumn	The labels are organized into a straight column to the right of the funnel data points.

Remarks

The values listed by this enumeration are used to set the FunnelSeriesView.LabelPosition property.

FunnelSeriesView Class

Represents a series view of the Funnel type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class FunnelSeriesView Inherits SeriesView, ISupportPercentValue
```

C#

```
public class FunnelSeriesView : SeriesView, ISupportPercentValue
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the pie type, refer to the Funnel View document.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=T179113.

This example demonstrates how to create a Funnel Chart and customize its common settings.

FunnelSeriesView Members

Represents a series view of the Funnel type.

The following tables list the members exposed by the FunnelSeriesView type.

Public Constructors

	Name	Description
	FunnelSeriesView	Initializes a new instance of the FunnelSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AlignToCenter	Gets or sets a value indicating whether a Funnel series should be center-aligned within a chart area.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)

FunnelSeriesView Constructor

Initializes a new instance of the FunnelSeriesView class with default settings.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public New()
```
C#
```
public FunnelSeriesView()
```

FunnelSeriesView Properties

Represents a series view of the Funnel type.

The following tables list the members exposed by the FunnelSeriesView type.

Public Constructors

	Name	Description
	FunnelSeriesView	Initializes a new instance of the FunnelSeriesView class with default settings.

Public Properties

	Name	Description
	ActualContourAppearance	Gets the actual contour appearance.
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AlignToCenter	Gets or sets a value indicating whether a Funnel series should be center-aligned within a chart area.
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ContourAppearance	Gets or sets the appearance of a funnel contour.
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)

ActualContourAppearance Property

Gets the actual contour appearance.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public ReadOnly Property ActualContourAppearance As ContourAppearance
```
C#
```
public ContourAppearance ActualContourAppearance { get; }
```

Property Value

A ContourAppearance object.

See Also
FunnelSeriesView Class
FunnelSeriesView Members
DevExpress.UI.Xaml.Charts Namespace

AlignToCenter Property

Gets or sets a value indicating whether a Funnel series should be center-aligned within a chart area.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property AlignToCenter As Boolean
```

C#

```
public bool AlignToCenter { get; set; }
```

Property Value

true, if the funnel series should be center-aligned; otherwise, **false**.

Remarks

Use the **AlignToCenter** property to control the alignment of a Funnel View within a chart area, when the data point labels are visible and the LabelPosition attached property is not set to **Center**.

The following images demonstrate the **AlignToCenter** property in action.

AlignToCenter = true	AlignToCenter = false

ContourAppearance Property

Gets or sets the appearance of a funnel contour.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ContourAppearance As ContourAppearance
```
C#
```
public ContourAppearance ContourAppearance { get; set; }
```

Property Value

ContourAppearance

HeightToWidthRatio Property

Gets or sets a value that specifies the height-to-width ratio of a Funnel View.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property HeightToWidthRatio As Double
```

C#

```
public Double HeightToWidthRatio { get; set; }
```

Property Value

A double value that specifies the height-to-width ratio of a funnel.

Remarks

Use the **HeightToWidthRatio** property to manually set the height-to-width ratio of a Funnel series. To enable auto-calculation of this ratio, use the HeightToWidthRatioAuto property.

The following images demonstrate the **HeightToWidthRatio** property in action.

HeightToWidthRatioAuto = true	HeightToWidthRatioAuto = false HeightToWidthRatio = 2

HeightToWidthRatioAuto Property

Gets or sets a value which indicates whether the height-to-width ratio of a Funnel Data Points should be auto-calculated.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property HeightToWidthRatioAuto As Boolean
```

C#

```
public bool HeightToWidthRatioAuto { get; set; }
```

Property Value

true, if the height-to-width ratio should be auto-calculated; otherwise, **false**.

Remarks

Use the **HeightToWidthRatioAuto** property, to toggle between automatic and manual height-to-width ratio definition for the Funnel View.

If the **HeightToWidthRatioAuto** property is set to **false**, the HeightToWidthRatio property becomes available, which allows you to manually define the desired ratio.

The following images demonstrate the **HeightToWidthRatioAuto** property in action.

HeightToWidthRatioAuto = true	HeightToWidthRatioAuto = false HeightToWidthRatio = 2

LabelPosition Attached Property

Gets or sets the position of labels relative to each other and the Funnel Chart Area.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
See GetLabelPosition, SetLabelPosition
```
C#
```
See GetLabelPosition, SetLabelPosition
```

Property Value

A FunnelLabelPosition enumeration value determining the position of a label against the corresponding data point.

Remarks

See the FunnelLabelPosition enumeration's description for more information on the available label positions.

PointAnimation Property

Specifies the animation for the data points.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property PointAnimation As FunnelAnimationBase
```

C#

```
public FunnelAnimationBase PointAnimation { get; set; }
```

Property Value

A DevExpress.UI.Xaml.Charts.FunnelAnimationBase class descendant, specifying the marker animation type.

Remarks

Use the **PointAnimation** property, to animate the data points of a Funnel View.

PointDistance Property

Gets or sets the distance between points of a Funnel series.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property PointDistance As Integer
```

C#

```
public int PointDistance { get; set; }
```

Property Value

An integer, representing the distance between points of a Funnel series view, in pixels.

Remarks

The following images demonstrate the **PointDistance** property in action.

PointDistance = 0	PointDistance = 5

Title Property

Gets or sets a series title.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property Title As SeriesTitle
```
C#
```
public SeriesTitle Title { get; set; }
```

Property Value

A SeriesTitle object that is the series title.

GetLabelPosition Method

Gets the value of the LabelPosition attached property for a specified data point label.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
static Public Function GetLabelPosition(
   ByVal labelOptions As SeriesLabelOptions
) As FunnelLabelPosition
```
C#
```
public static FunnelLabelPosition GetLabelPosition(
   SeriesLabelOptions labelOptions
)
```

Parameters
labelOptions
The data point label from which the property value is read.

Return Value

The FunnelLabelPosition property value for the data point label.

SetLabelPosition Method

Sets the value of the LabelPosition attached property to a specified data points label.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
static Public Sub SetLabelPosition(
   ByVal labelOptions As SeriesLabelOptions,
   ByVal value As FunnelLabelPosition
)
```

C#

```
public static void SetLabelPosition(
   SeriesLabelOptions labelOptions,
   FunnelLabelPosition value
)
```

Parameters

labelOptions
The data points label to which the attached property is written.
value
The required FunnelLabelPosition value.

HorizontalPosition Enumeration

Lists the values that specify the legend's horizontal alignment within the chart.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum HorizontalPosition
```
C#
```
public enum HorizontalPosition
```

Members

Name	Description
Center	Centers a legend horizontally within the chart area.
Left	The legend is positioned on the left side of the chart area.
LeftOutside	The legend is positioned to the left of the Chart area.
Right	The legend is positioned on the right side of the Chart Area.
RightOutside	The legend is positioned to the right of the Chart area.

Remarks

The values listed by this enumeration are used to set the Legend.HorizontalPosition property.

For more information, refer to Legend.

See Also
DevExpress.UI.Xaml.Charts Namespace
Legend

© 2018 Developer Express Inc.

Legend Class

Represents a chart control's legend.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class Legend Inherits ChartElement
```

C#

```
public class Legend : ChartElement
```

Remarks

An object of the **Legend** type is returned via the ChartBase.Legend property.

The legend identifies chart elements by markers coupled with text.

A series (or its data points) is represented in the legend if the Series.ShowInLegend property is enabled. To also be listed in a legend, other elements (e.g., strips) should have their **LegendText** property defined (e.g. Strip.LegendText).

To control a legend's alignment within a chart, use the HorizontalPosition and VerticalPosition properties.

A legend and its items are customized via the ItemTemplate and ReverseItems properties.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

Legend Members

Represents a chart control's legend.

The following tables list the members exposed by the Legend type.

Public Constructors

	Name	Description
	Legend	Initializes a new instance of the Legend class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

HorizontalPosition Property

Gets or sets the legend's horizontal position within the chart control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property HorizontalPosition As HorizontalPosition
```

C#

```
public HorizontalPosition HorizontalPosition { get; set; }
```

Property Value

A HorizontalPosition enumeration member which specifies the legend's horizontal position within the chart control.

Remarks

To specify the legend's vertical position, use the VerticalPosition property.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4234.

This example demonstrates how to create a simple Cartesian chart with 3 Stacked Bar series, populate them with data and adjust common settings.

IsMovableInsideDiagram Property

Gets or sets a value indicating if a legend is movable inside a chart area at runtime.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property IsMovableInsideDiagram As Boolean
```
C#
```
public bool IsMovableInsideDiagram { get; set; }
```

Property Value

A Boolean object.

ItemTemplate Property

Gets or sets the template for the legend items.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property ItemTemplate As DataTemplate
```
C#
```
public DataTemplate ItemTemplate { get; set; }
```

Property Value

A **System.Windows.DataTemplate** object that contains the template for the legend items.

MaximumRowsOrColumns Property

Gets or sets the maximum number of rows allowed (if a legend displays its items vertically) or columns (if a legend displays its items horizontally).

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property MaximumRowsOrColumns As Integer
```

C#

```
public int MaximumRowsOrColumns { get; set; }
```

Property Value

An integer value.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4239.

The following example demonstrates how to create a simple Pie Chart with one series.

Xaml

```
 (MainPage.xaml)
<Page
    xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
    xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
    xmlns:local="using:PieChart"
    xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
    xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
    xmlns:Charts="using:DevExpress.UI.Xaml.Charts"
    x:Class="PieChart.MainPage"
    mc:Ignorable="d">
    <Grid Background="{StaticResource ApplicationPageBackgroundThemeBrush}">
        <Charts:PieChart Margin="50" ToolTipEnabled="True">
            <Charts:Series>
                <Charts:Series.View>
                    <Charts:PieSeriesView LegendPointPattern="{}{A}"/>
                </Charts:Series.View>
                <Charts:Series.Data>
                    <Charts:DataPointCollection>
                        <Charts:DataPoint Argument="USA" Value="9.63142" />
                        <Charts:DataPoint Argument="Canada" Value="9.98467" />
                        <Charts:DataPoint Argument="Russia" Value="17.0752" />
                        <Charts:DataPoint Argument="Others" Value="81.2" />
                        <Charts:DataPoint Argument="India" Value="3.28759" />
                        <Charts:DataPoint Argument="Australia" Value="7.68685" />
                        <Charts:DataPoint Argument="Brazil" Value="8.511965" />

ReverseItems Property

Gets or sets a value indicating whether the order of legend items is reversed.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property ReverseItems As Boolean
```

C#

```
public bool ReverseItems { get; set; }
```

Property Value

true to reverse legend items; **false** to preserve their original order.

VerticalPosition Property

Gets or sets the legend's vertical position within the chart control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property VerticalPosition As VerticalPosition
```

C#

```
public VerticalPosition VerticalPosition { get; set; }
```

Property Value

A VerticalPosition enumeration member which specifies the legend's vertical position within the chart control.

Remarks

To specify the legend's horizontal position, use the HorizontalPosition property.

LineSeriesView Class

Represents a series view of the Line type.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class LineSeriesView Inherits ScatterLineSeriesView
```

C#

```
public class LineSeriesView : ScatterLineSeriesView
```

Remarks

A particular view type can be defined for a series via its Series.View property.

For more information on series views of the line type, refer to the Line document.

LineSeriesView Members

Represents a series view of the Line type.

The following tables list the members exposed by the LineSeriesView type.

Public Constructors

	Name	Description
	LineSeriesView	Initializes a new instance of the LineSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualStrokeStyle	Gets the actual stroke style of a scatter line. (Inherited from **ScatterLineSeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited

S	ManipulationStartedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
S	ManipulationStartingEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Margin	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	MarginProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MarkerSize	Gets or sets the size of data point markers. (Inherited from **ScatterLineSeriesView**)
	MaxHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	MaxHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MaxWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	MaxWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)

© 2018 Developer Express Inc.

	MinHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	MinWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Name	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	NameProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Opacity	(Inherited from **Windows.UI.Xaml.UIElement**)
	OpacityProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Padding	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	PaddingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Palette	Gets or sets a palette used to color series points. (Inherited from **SeriesView**)
	Parent	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	PointAnimation	Specifies the animation for data points of series with markers. (Inherited from **MarkerSeriesView**)
	PointerCanceledEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerCaptureLostEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerCaptures	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerCapturesProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerEnteredEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerExitedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerMovedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)

© 2018 Developer Express Inc.

	PointerPressedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerReleasedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	PointerWheelChangedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Projection	(Inherited from **Windows.UI.Xaml.UIElement**)
	ProjectionProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RangeControlViewType	Gets or sets a value that specifies which view type should be used to represent the current series in a Range Control.
	RenderSize	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransform	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOrigin	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformOriginProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RenderTransformProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	RequestedTheme	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RequestedThemeProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	Resources	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	RightTappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	SelectedItem	Gets or sets the currently selected item in the series. (Inherited from **SeriesView**)
	SelectedItemBrush	Gets or sets the color of the selected series point. (Inherited from **SeriesView**)
	SelectedItems	Gets or sets the collection of selected items of the LineSeriesView object. (Inherited from **SeriesView**)
	SeriesAnimation	Provides access to the settings of a series animation. (Inherited from **ScatterLineSeriesView**)
	ShowLabels	Gets or sets a value indicating whether labels should be visible for this series.

© 2018 Developer Express Inc.

		(Inherited from **SeriesView**)
	ShowMarkers	Gets or sets a value indicating whether series point markers are visible. (Inherited from **ScatterLineSeriesView**)
	ShowToolTipOnSelectItem	Gets or sets a value specifying whether or not to show a tooltip every time a series (or a series point) is selected. (Inherited from **SeriesView**)
	StrokeStyle	Specifies the line style settings for the Scatter Line series. (Inherited from **ScatterLineSeriesView**)
	Style	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	StyleProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	TabIndex	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabIndexProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	TabNavigation	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TabNavigationProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Tag	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TagProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	TappedEvent	(Inherited from **Windows.UI.Xaml.UIElement**)
	Template	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	TemplateProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	ToolTipPointPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within a tooltip that appears for a series point. (Inherited from **SeriesView**)
	ToolTipPointTemplate	Specifies the tooltip template for this series. This is a dependency property. (Inherited from **SeriesView**)

© 2018 Developer Express Inc.

	ToolTipSeriesPattern	Gets or sets a string which represents the pattern specifying the text to be displayed within the tooltip that appears for a series. (Inherited from **SeriesView**)
	ToolTipSeriesTemplate	Gets or sets the template that defines the presentation of the tooltip for this series. (Inherited from **SeriesView**)
	Transform3D	(Inherited from **Windows.UI.Xaml.UIElement**)
S	Transform3DProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Transitions	(Inherited from **Windows.UI.Xaml.UIElement**)
S	TransitionsProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Triggers	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	UseLayoutRounding	(Inherited from **Windows.UI.Xaml.UIElement**)
S	UseLayoutRoundingProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	UseSystemFocusVisuals	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	UseSystemFocusVisualsProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)

LineSeriesView Properties

Represents a series view of the Line type.

The following tables list the members exposed by the LineSeriesView type.

Public Constructors

	Name	Description
	LineSeriesView	Initializes a new instance of the LineSeriesView class with default settings.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualStrokeStyle	Gets the actual stroke style of a scatter line. (Inherited from **ScatterLineSeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers. (Inherited from **MarkerSeriesView**)
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited

RangeControlViewType Property

Gets or sets a value that specifies which view type should be used to represent the current series in a Range Control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property RangeControlViewType As RangeControlViewType
```

C#

```
public RangeControlViewType RangeControlViewType { get; set; }
```

Property Value

A RangeControlViewType object.

MarkerSeriesView Class

Represents the base class for all series views that contain data point markers.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class MarkerSeriesView Inherits CartesianSeriesView
```

C#

```
public abstract class MarkerSeriesView : CartesianSeriesView
```

MarkerSeriesView Members

Represents the base class for all series views that contain data point markers.

The following tables list the members exposed by the MarkerSeriesView type.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
S	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers.
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)

MarkerSeriesView Properties

Represents the base class for all series views that contain data point markers.

The following tables list the members exposed by the MarkerSeriesView type.

Public Properties

	Name	Description
	ActualHeight	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualHeightProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	ActualLabelOptions	Gets the actual label options. (Inherited from **SeriesView**)
	ActualPalette	Gets the actual palette of a series view. (Inherited from **SeriesView**)
	ActualWidth	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
S	ActualWidthProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	AllowDrop	(Inherited from **Windows.UI.Xaml.UIElement**)
S	AllowDropProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	Angle	Gets or sets the angle which controls the position of data point labels for all series with markers.
	AnimateCommand	Returns a command that starts animation of a series' contents. (Inherited from **SeriesView**)
	Antialiasing	Gets or sets whether anti-aliasing (smoothing) is applied to this series view. (Inherited from **SeriesView**)
	Background	(Inherited from **Windows.UI.Xaml.Controls.Control**)
S	BackgroundProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BaseUri	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	BorderBrush	(Inherited from **Windows.UI.Xaml.Controls.Control**)

© 2018 Developer Express Inc.

	BorderBrushProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThickness	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	BorderThicknessProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Brush	Gets or sets the color of the series view. This is a dependency property. (Inherited from **CartesianSeriesView**)
	CacheMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CacheModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDrag	(Inherited from **Windows.UI.Xaml.UIElement**)
	CanDragProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	CharacterSpacing	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	CharacterSpacingProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**)
	Clip	(Inherited from **Windows.UI.Xaml.UIElement**)
	ClipProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	ColorEach	Gets or sets a value that specifies whether each data point of a series is shown in a different color. (Inherited from **CartesianSeriesView**)
	CompositeMode	(Inherited from **Windows.UI.Xaml.UIElement**)
	CompositeModeProperty	(Inherited from **Windows.UI.Xaml.UIElement**)
	DataChangingAnimationMode	Specifies how chart data should be animated on data changes. (Inherited from **SeriesView**)
	DataContext	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DataContextProperty	(Inherited from **Windows.UI.Xaml.FrameworkElement**)
	DefaultStyleKeyProperty	(Inherited from **Windows.UI.Xaml.Controls.Control**

Angle Attached Property

Gets or sets the angle which controls the position of data point labels for all series with markers.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
See GetAngle, SetAngle
```

C#

```
See GetAngle, SetAngle
```

Property Value

A System.Double value specifying the angle, in degrees, for the position of data point labels.

Remarks

The **Angle** property affects the position of data point labels relative to the corresponding data points. The angle value set for this property specifies the inclination of the connector line between a data point and its label. The angle is measured in degrees, and counterclockwise from the horizontal.

PointAnimation Property

Specifies the animation for data points of series with markers.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property PointAnimation As MarkerAnimationBase
```
C#
```
public MarkerAnimationBase PointAnimation { get; set; }
```

Property Value

A MarkerAnimationBase class descendant, specifying the animation type.
