Group Property

Gets or sets an object which specifies how to group donuts into nested donuts.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Group As Object
```

C#

```
public object Group { get; set; }
```

Property Value

A System.Object, which is used to identity donuts of the same group.

Remarks

Use the **Group** property to combine several NestedDonutSeriesView objects into the same group. The Donut series view, whose **Group** property value is equal, is united with the same group and are nested into it. Donuts with another value of the **Group** property can be combined into another group of nested donuts, also displayed on the same chart.

InnerIndent Property

Gets or sets an indent between two donuts nested one into another.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Property InnerIndent As Double
```
C#
```
public Double InnerIndent { get; set; }
```

Property Value

A Double value which specifies an indent (in pixels).

Weight Property

Gets or sets the weight of the current NestedDonutSeriesView in a group.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property Weight As Double
```

C#

```
public Double Weight { get; set; }
```

Property Value

A System.Double value, which specifies the donut weight.

Remarks

Several NestedDonutSeriesView objects, whose Group property values are equal, are united into the same group of donuts, one nested into another. By default, all NestedDonutSeriesView views have the same weight and therefore have the same thickness. If you need to change the thickness of any nested donut, set the required value to its **Weight** property.

PieChart Class

The Pie Chart control to plot series of data points on a pie chart area.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class PieChart Inherits ChartBase, IChartViewHolder
```

C#

```
public class PieChart : ChartBase, IChartViewHolder
```

Remarks

The **PieChart** class represents a visual control intended for graphical data representation. It is comprised of separate elements, such as legend, etc. To learn more about them, refer to Visual Elements.

To display a Series on a chart, it's necessary to add this series to the collection returned by the ChartBase.Series property. Note that the **PieChart** control can display only series, for which Series.View is one of the PieSeriesView class descendants (e.g., PieSeriesView, DonutSeriesView, etc.).

To display series of the AreaSeriesView, LineSeriesView and other Cartesian types, use the CartesianChart control instead.

For more information on using chart controls, please refer to the Concepts section.

EqualPieSize Property

Gets or sets a value that specifies whether pies in a chart are equal in size.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property EqualPieSize As Boolean
```

C#

```
public bool EqualPieSize { get; set; }
```

Property Value

true, if pie sizes are equal in a chart; otherwise, **false**.

Remarks

Use the **EqualPieSize** property when you wish to set the size of all pies to the same size. Note that the equal width and height size is derived from the minimum width and height among all pies in a chart.

ScaleType Enumeration

Contains the values used to specify the scale type for the argument and value data of data points.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax
Visual Basic
```
Public Enum ScaleType
```
C#

Members

Name	Description
Auto	A scale type is detected automatically based on the type of underlying data. This means that numerical data will be treated as numerical, date-time data as date-time, qualitative as qualitative values.
DateTime	Identifies the **DateTime** data scale. This means that data provided for the DataPointCollection.Points will be treated as **DateTime** values, and will be shown on the axis as **DateTime** values (e.g., **January, 2003**, **January, 2004**, and **January, 2005**).
Numerical	Identifies the **Numerical** data scale. This means that data provided for the DataPointCollection.Points will be treated as numerical values, and will be shown on the axis as numbers (e.g., **100**, **200**, and **300**).
Qualitative	Identifies the **Qualitative** data scale. This means that data provided for the DataPointCollection.Points will be treated as qualitative values, and will be shown on the axis as textual representations (e.g., **A**, **B**, and **C**).

Remarks

The values listed by the **ScaleType** enumerator are used to set the DataPointCollection.ArgumentScaleType and DataPointCollection.ValueScaleType properties.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4362.

The following example demonstrates how to bind a chart to data provided by a **ViewModel**.

To do this, it is necessary to assign the DataSourceAdapter object to the Data property and specify the datasource for the adapter via its DataSourceAdapter.DataSource property.

C#

```
 (MainPage.xaml.cs)
using System;
using Windows.UI.Xaml.Controls;
using Windows.UI.Xaml.Navigation;
namespace BindChart {
    public sealed partial class MainPage : Page {
        public MainPage() {
            this.InitializeComponent();
            DataContext = new ViewModel() {
                Start = 10000,
                Count = 50000,
                Step = TimeSpan.FromHours(3),
            };
        }
        protected override void OnNavigatedTo(NavigationEventArgs e) {
        }
    }
}
```

C#

```
 (ViewModel.cs)

using System.Collections;
using System.Collections.Generic;

SeriesCollection Class

Represents a collection that stores individual series within a chart control.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class SeriesCollection Inherits CollectionBase(of Series)
```

C#

```
public class SeriesCollection : CollectionBase<Series>
```

Remarks

Data series which are defined explicitly are maintained by a chart's diagram within its ChartBase.Series collection. This collection is represented by the **SeriesCollection** class. The properties and methods exposed by the **SeriesCollection** class can be used to perform common collection operations, such as adding new or deleting existing items. Each item of the collection is represented by a Series object. Individual series can be accessed using indexer notation.

Remarks

Use the **Pattern** property to define a pattern for displaying text by data point labels. Various placeholders enclosed in braces correspond to the available display patterns. For example, a pair of placeholders specified together (e.g., **{A} - {V}**), will cause each data point to be represented by both its argument and value, separated by a hyphen.

A full list of available placeholders is detailed below.

Pattern	Description
{A}	Displays a series point *argument*.
{V}	Displays series point *values*.
{VP}	Displays series point *values* as percentages (for a Pie, Funnel, Nested Donut series and Full-Stacked series).
{S}	Displays the *name* of the series.
{G}	Displays the *name* of a stacked group.

You can also use standard and custom format specifiers, together with the placeholders to format numeric and date/time values (e.g., {V:F1}).

A full list of available placeholders is detailed below.

Pattern	Description
{A}	Displays a series point *argument*.

{VP}	Displays series point *values* as percentages (for a Pie and Nested Donut series and Full-Stacked series).
{S}	Displays the *name* of the series.
{G}	Displays the *name* of a stacked group.

LegendPointPattern Property

Gets or sets a string which represents the pattern specifying the text to be displayed within legend items.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Property LegendPointPattern As String
```

C#

```
public string LegendPointPattern { get; set; }
```

Property Value

A System.String, which represents the pattern. The default value is System.String.Empty.

Remarks

Use the **LegendPointPattern** property to define a pattern for displaying text by the legend. Various placeholders enclosed in braces correspond to the available display patterns. For example, a pair of placeholders specified together (e.g., **{A} - {V}**), will cause each data point to be represented by both its argument and value, separated by a hyphen.

A full list of available placeholders is detailed below.

Pattern	Description
{A}	Displays a series point *argument*.
{V}	Displays series point *values*.
{VP}	Displays series point *values* as percentages (for a Pie and Nested Donut series and Full-Stacked series).
{S}	Displays the *name* of the series.
{G}	Displays the *name* of a stacked group.

Note

The **LegendPointPattern** property is in affect when the CartesianSeriesView.ColorEach property is set to **true** (for Cartesian charts).

Use the **LegendPointPattern** property directly for the Pie chart without specifying the **ColorEach** property (this property is enabled by default).

Before specifying the {S} placeholder for a series, make sure a series name is specified in the Series.DisplayName property.

```

Property Value

true if markers are connected using inverted steps; **false** if standard steps are use to connect markers.

Remarks

Use the **InvertedStep** property to specify the manner in which data point markers are connected using step lines. Step lines can be displayed between data point markers using either standard steps (the **InvertedStep** property is set to **false**) or inverted steps (the **InvertedStep** property is set to **true**).

VisualAxisRange Class

Defines the leftmost and rightmost values that are currently visible on an axis.

Namespace: DevExpress.UI.Xaml.Charts

WholeAxisRange Class

Defines the minimum and possible values that can be displayed on an axis.

Namespace: DevExpress.UI.Xaml.Charts
Assembly: DevExpress.UI.Xaml.Charts.v18.1.dll

Syntax

Visual Basic

```
Public Class WholeAxisRange Inherits AxisRangeBase
```

C#

```
public class WholeAxisRange : AxisRangeBase
```

Remarks

An instance of the **WholeAxisRange** class can be obtained via the AxisBase.WholeRange property, which defines the whole available range of axis values. The AxisBase.VisualRange property defines which part of the AxisBase.WholeRange should be currently visible on a chart.

So, if the **VisualRange** is equal to the **WholeRange**, no scrolling and zooming is applied to chart data. And, if the **VisualRange** is less than the **WholeRange**, chart data is zoomed in and scrolled.

Remarks

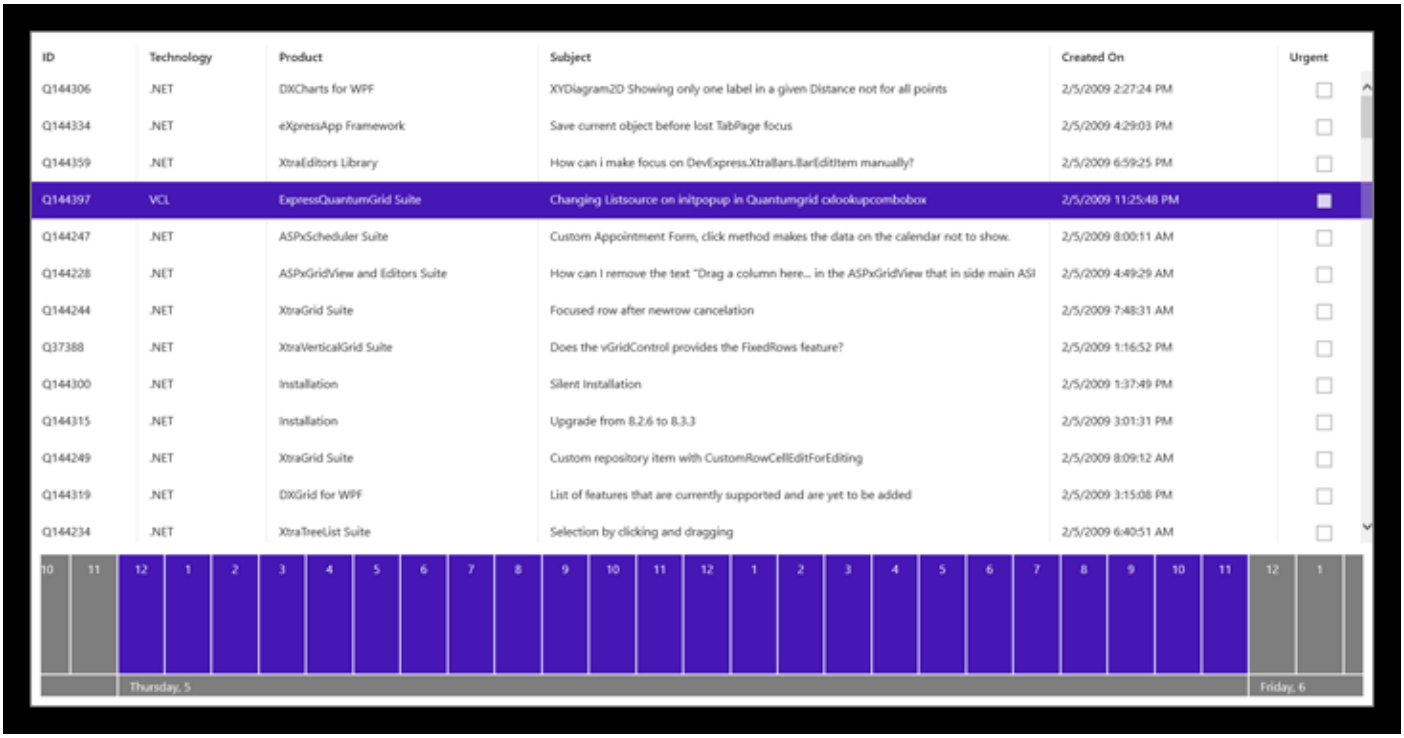
The **Range Control** provides a highly efficient way in which to specify a range of values within an application. Its innovative and touch-friendly design simplifies the manner in which end-users are able to pass parameters within UI. And, because of DirectX rendering, applications that rely on the Range Control will always remain responsive, regardless of the amount of information displayed on-screen.

The **Range Control**'s features include: range zooming, snapping to intervals, immediate range update, animation support, adjustable appearance, etc.

The **Range Control** has a client area where a range is visualized. The **Range Control** never draws values or graphs within the client area itself. A range is visualized by a separate **Range Control Client** object. The following range clients are supported:

- **Date Range Selector**

The DevExpress Universal Date Range Selector is the perfect choice when your interface requires that users specify a range of date values and when you need a touch-friendly way in which to do so. With its smooth animated scrolling and zooming capabilities, and its ability to auto determine the appropriate information to display based on the scale factor used, the Date Range Selector is the most efficient way to choose a range of values on a Windows 10 device.



- **Cartesian Chart Range Selector**

With a single property setting, you can integrate the Range Control with the DevExpress Universal Cartesian Chart and display any series and associated data within it. The Range Control makes it easy to restrict the range of values within the Chart using a mouse or touch and offers elegant visual feedback for the actual value range represented in the Chart.

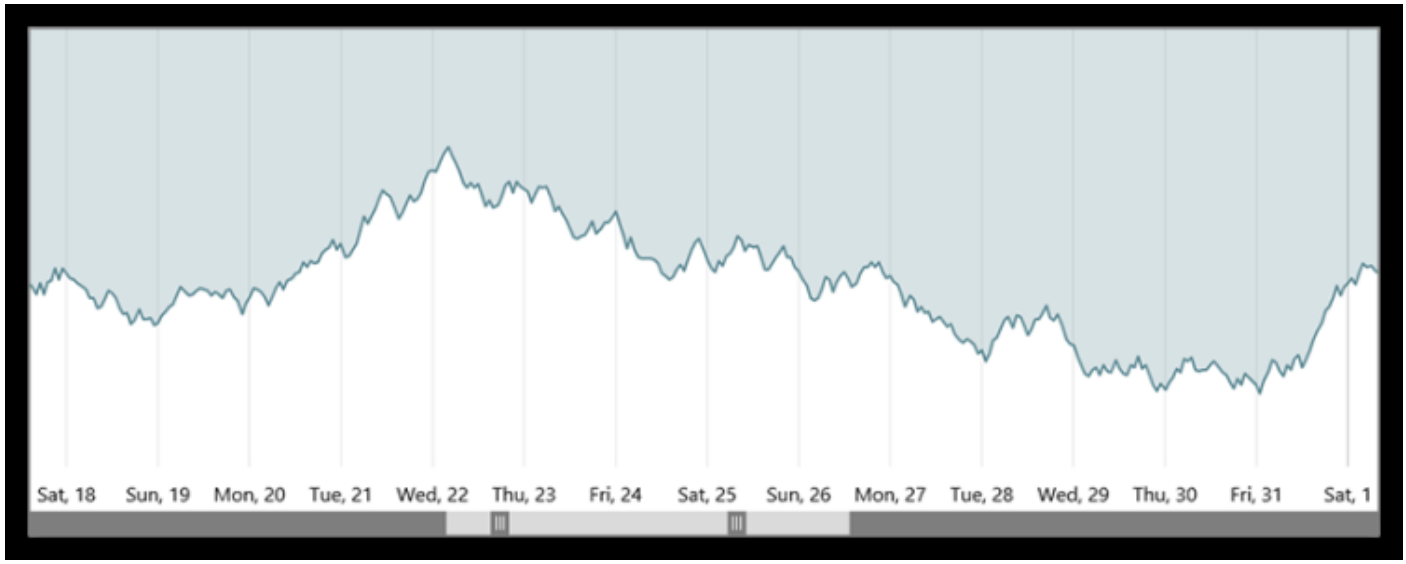
- **Spark Range Selector**

A lightweight standalone DevExpress Universal Spark Chart optimized to display large amounts of data. With 4 built-in Series types (Spark Point, Spark Line, Spark Area, Spark Bar), the DevExpress Universal Spark Range Selector ships with the following touch-friendly features:



- **Snap to Interval**
- **Data Aggregation**
- **Async Data Processing**
- **Date-Time and numeric value source support**

Default	When set to **Default**, the Strong automatic completion mode is used.
None	The automatic completion feature is disabled.
Optimistic	When an end-user enters a character in an empty edit box for the first time, the editor automatically fills all the following placeholders with the default values. For placeholders that accept only numeric values, the '0' character is the default. For placeholders that accept word characters, the "a" character is the default.
Strong	Each time an end-user types a character, the editor determines if the following placeholder can be filled automatically. If only a specific character can be inserted in this position, the editor automatically displays this character, and moves the caret to the right of this character.

Visual Basic

```
event Public EditValueChanged As EditValueChangedEventHandler
```

C#

```
public event EditValueChangedEventHandler EditValueChanged
```

Event Data

The event handler receives an argument of type EditValueChangedEventArgs containing data related to this event.

The following **EditValueChangedEventArgs** properties provide information specific to this event.

Property	Description
Handled	
NewValue	Gets a new value that has been assigned to the editor.
OldValue	Gets the previous edit value, which has been replaced by the new value.

Remarks

The editor's value is specified by the EditValue property. Before the editor's value is changed, the editor raises the Validate event, and allows you to check whether a new value is valid. If the new value is valid, it is accepted and the **EditValueChanged** event is raised. If the value is invalid, the **EditValueChanged** event isn't raised.

To disable the editor's validation mechanism, set the CausesValidation property to **false**. In this instance, the **EditValueChanged** event is raised each time the edit value changes.

EditValueChanging Event

Occurs before the editor's value is changed.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
event Public EditValueChanging As EditValueChangingEventHandler
```

C#

```
public event EditValueChangingEventHandler EditValueChanging
```

Event Data

The event handler receives an argument of type EditValueChangingEventArgs containing data related to this event.

The following **EditValueChangingEventArgs** properties provide information specific to this event.

Property	Description
Handled	
IsCancel	Gets or sets a value indicating whether the event should be canceled.
NewValue	Gets a new value to be assigned to the editor.
OldValue	Gets or sets the current edit value, which should be replaced by the new value.

Remarks

The **EditValueChanging** event is raised when the editor's value is about to be changed (a user types or deletes a character, presses a spin button, etc.). The potential new value is returned by the event parameter's **NewValue** property. The current value is returned by the **OldValue** property. To cancel posting a **NewValue** to EditValue, set the **Handled** and event parameter's **IsCancel** properties to **true**.

After the editor's value has been changed, the EditValueChanged event is fired.

Validate Event

Enables you to validate the editor's value.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
event Public Validate As ValidateEventHandler
```

C#

```
public event ValidateEventHandler Validate
```

Event Data

The event handler receives an argument of type ValidationEventArgs containing data related to this event.

The following **ValidationEventArgs** properties provide information specific to this event.

Property	Description
ErrorContent	Gets or sets an object that describes the validation error.
ErrorType	Gets or sets the error type.
Handled	
IsValid	Gets or sets a value specifying whether the value is valid.
UpdateSource	Gets the action that caused the validation.
Value	Gets the editor's value.

Remarks

Handle the **Validate** event to manually validate the editor (e.g. to limit the range of valid values, implement a custom conditional validation mechanism, etc).

To specify when the editor should automatically validate its value, use the ValidateOnEnterKeyPressed and ValidateOnTextInput properties. To manually force the editor's validation, call the DoValidate method.

Note
The **Validate** event is not raised if the editor's CausesValidation property is set to **false**.

BeginInit Method

Starts the BaseEdit's initialization. Initialization occurs at runtime.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Overrides Public Sub BeginInit()
```

C#

```
public override void BeginInit()
```

Remarks

The Visual Studio .NET design-time environment calls this method to start initializing a component used on a form, or by another component. The EndInit method ends the initialization. Use the **BeginInit** and **EndInit** methods to prevent the control from being used until it has been completely initialized.

ClearError Method

Clears error notification and resets the editor's value.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Public Sub ClearError()
```

C#

```
public void ClearError()
```

Remarks

The validation takes place when a value specified by an end-user (e.g., a user types within a text editor and presses the ENTER key) is to be assigned to the editor's EditValue property. If the new value is invalid, it isn't accepted by the editor and not assigned to the EditValue property. In this instance, an end-user can correct this value or reset it to the previous value by pressing the ESC key. To do this in code, use the **ClearError** method.

DoValidate Method

Validates the editor.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Overridable Public Function DoValidate() As Boolean
```

C#

```
public virtual bool DoValidate()
```

Return Value

true if the editor's value has been validated; **false** if the editor's value is invalid.

Remarks

The **DoValidate** method is automatically called by the editor or its container control, each time the editor's value should be validated. This occurs when an end-user accepts the edit value (for example, when the editor is about to lose focus).

Use the **DoValidate** method to manually force the validation. If the editor's CausesValidation property is set to **true**, the editor fires the Validate event, allowing you to manually validate its value.

AllowRoundOutOfRangeValue Property

Gets or sets whether automatic rounding of out of range values is enabled.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Public Property AllowRoundOutOfRangeValue As Boolean
```

C#

```
public bool AllowRoundOutOfRangeValue { get; set; }
```

Property Value

true to automatically round out of range values; otherwise, **false**.

Remarks

The range of values which can be assigned to the editor's value is specified by the MinValue and MaxValue properties. If the **AllowRoundOutOfRangeValue** property is set to **true** and an end-user inputs a value which is greater than the maximum allowed value, the edit value is automatically set to MaxValue. Otherwise, if the value entered by an end-user is less than the minimum allowed value, the edit value is set to MinValue.

A template that defines the presentation of data cells is specified by the CellItemTemplate property. If you have more than one template that can be used to render cell items, you can implement custom logic to choose the required template. To do this, derive from the Windows.UI.Xaml.Controls.DataTemplateSelector class, implement the **SelectTemplateCore** method that returns a template which meets the required condition, and assign it to the **CellItemTemplateSelector** property.

If both the CellItemTemplate and **CellItemTemplateSelector** are specified, a cell is rendered using the template returned by the template selector. If the template selector returns **null**, the template specified by the CellItemTemplate property is used.

AllowRoundOutOfRangeValue Property

Gets or sets whether automatic rounding of out of the range values is enabled. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Public Property AllowRoundOutOfRangeValue As Boolean
```

C#

```
public bool AllowRoundOutOfRangeValue { get; set; }
```

Property Value

true to automatically round out of the range values; otherwise, **false**.

Remarks

The range of values which can be assigned to the editor's value is specified by the MinValue and MaxValue properties. If the **AllowRoundOutOfRangeValue** property is set to **true** and an end-user inputs a value which is greater than the maximum allowed value, the edit value is automatically set to MaxValue. Otherwise, if the value entered by an end-user is less than the minimum allowed value, the edit value is set to MinValue.

SpinEdit Class

Represents an editor with spin buttons used to adjust a numerical value.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Public Class SpinEdit Inherits TextEdit
```

C#

```

Remarks

The **SpinEdit** class represents a text editor with a pair of spin buttons that end-users can click to adjust a value. Spin buttons are used to increment or decrement the editor's value displayed in the text edit region.

The spin editor's value is specified via the Value property. The editor's increment value, by which the edit value is changed every time the editor is spun, is specified by the Increment property.

The minimum and maximum allowed values are specified by the MinValue and MaxValue properties, respectively. Use the Minimize or Maximize method to set the editor's value to the minimum or maximum value, respectively.

AllowRoundOutOfRangeValue Property

Gets or sets whether automatic rounding of out of range values is enabled. This is a dependency property.

Namespace: DevExpress.UI.Xaml.Editors
Assembly: DevExpress.UI.Xaml.Editors.v18.1.dll

Syntax

Visual Basic

```
Public Property AllowRoundOutOfRangeValue As Boolean
```

C#

```
public bool AllowRoundOutOfRangeValue { get; set; }
```

Property Value

true to automatically round out of range values; otherwise, **false**.

Remarks

The range of values which can be assigned to the editor's value is specified by the MinValue and MaxValue properties. If the **AllowRoundOutOfRangeValue** property is set to **true** and an end-user inputs a value which is greater than the maximum allowed value, the edit value is automatically set to MaxValue. Otherwise, if the value entered by an end-user is less than the minimum allowed value, the edit value is set to MinValue.

The **AllowRoundOutOfRangeValue** option is not in effect if the editor's value is specified in code.
