ArcScale Class

An arc scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScale Inherits Scale
```

C#

```
public class ArcScale : Scale
```

Remarks

Arc scale is intended to be used with the CircularGauge. An instance of an arc scale is represented by the ArcScale object. It can be accessed as an item of the ArcScaleCollection object returned by the CircularGauge.Scales property.

An Arc Scale consists of tickmarks, labels, custom labels, ranges, layers and a spindle cap. As value indicators, it can use needles, markers and range bars.

Example

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4241.	

The following example demonstrates how to create a Circular Gauge with two needles, three ranges, one marker and one range bar.

EndAngle Property

Gets or sets the angle that specifies the scale end position.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property EndAngle As Double
```

C#

```
public Double EndAngle { get; set; }
```

Property Value

A System.Double value that is the end angle of the scale.

Remarks

A scale's start and end positions are defined by the StartAngle and **EndAngle** properties. In this case, an angle increases in the clockwise direction and decreases in a counterclockwise direction.

Note that the **EndAngle** can either be less than the **StartAngle** or greater than the **StartAngle** - both situations are correct.

Example

Show Me

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4241.

The following example demonstrates how to create a Circular Gauge with two needles, three ranges, one marker and one range bar.

Syntax

Visual Basic

```
Public ReadOnly Property Layers As ArcScaleLayerCollection

StartAngle Property

Gets or sets the angle that specifies the scale start position.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property StartAngle As Double
```

C#

```
public Double StartAngle { get; set; }

Property Value

A System.Double value that is the start angle of the scale.

Remarks

A scale's start and end positions are defined by the **StartAngle** and EndAngle properties. In this case, an angle increases in the clockwise direction and decreases in a counterclockwise one.

Note that the **StartAngle** property can be either less than the **EndAngle** or greater than the **EndAngle** - both situations are correct.

ArcScaleIndicatorCollection<T> Class

A collection that stores value indicators of a particular circular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```

ArcScaleLabelOptions Class

Contains appearance and behavior options for arc scale labels.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleLabelOptions Inherits ScaleLabelOptions
```

C#

```
public class ArcScaleLabelOptions : ScaleLabelOptions
```

Remarks

The options provided by an **ArcScaleLabelOptions** instance can be accessed via the ArcScale.LabelOptions property of an ArcScale object.

To define the appearance of the arc scale labels, use the ScaleLabelOptions.ShowFirst, ScaleLabelOptions.ShowLast, Orientation and ScaleLabelOptions.ZIndex properties.

The behavior of the labels are set by the ScaleLabelOptions.Addend, ScaleLabelOptions.Multiplier and ScaleLabelOptions.FormatString properties.

For more information on labels, refer to the Labels (Circular Scale) document.

Orientation Property

Provides different types of orientation for labels on the Circular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax
Visual Basic
```
Public Property Orientation As ArcScaleLabelOrientation
```
C#
```
public ArcScaleLabelOrientation Orientation { get; set; }
```

Property Value

An ArcScaleLabelOrientation object that specifies possible ways labels can be oriented.

ArcScaleLabelOrientation Enumeration

Lists the possible ways arc scale labels can be oriented.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax
Visual Basic
```
Public Enum ArcScaleLabelOrientation
```
C#
```
public enum ArcScaleLabelOrientation
```

Members

Name	Description
BottomToTop	Arc scale labels are painted from bottom to top.
LeftToRight	Arc scale labels are painted from left to right.
Radial	Arc scale labels are painted radially to the corresponding values on a scale.
Tangent	Arc scale labels are painted tangentially to the corresponding values on a scale.
TopToBottom	Arc scale labels are painted from top to bottom.

Remarks

The values listed by the **ArcScaleLabelOrientation** enumeration are used to set the ArcScaleLabelOptions.Orientation property.

ArcScaleLayer Class

A layer that contains properties to define the visual presentation of a circular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleLayer Inherits ScaleLayerBase
```

C#

```
public class ArcScaleLayer : ScaleLayerBase
```

Remarks

A layer specifies the appearance of the circular scale's elements. It is represented by a ArcScaleLayer object contained in the ArcScaleLayerCollection object, which can be accessed via the ArcScale.Layers property.

When a new layer is added to the circular scale, it is painted behind all other elements, because by default, its GaugeOptionsBase.ZIndex is less than other elements. If you want to display layers in front of scale elements, set their **Zindex** to a greater value.

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4241.	

The following example demonstrates how to create a Circular Gauge with two needles, three ranges, one marker and one range bar.

Options Property

Gets or sets the options of a marker that specify its shape and position on a Circular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Options As ArcScaleMarkerOptions
```

C#

```
public ArcScaleMarkerOptions Options { get; set; }
```

Property Value

An ArcScaleMarkerOptions object that contains the settings of the marker.

Remarks

Use the **ArcScaleMarkerOptions** object returned by the **Options** property to customize different marker settings (e.g., MarkerOptionsBase.FactorHeight and MarkerOptionsBase.FactorWidth to change the marker's shape on the Circular scale).

ArcScaleMarkerCollection Class

A collection that stores the markers of a particular arc scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleMarkerCollection Inherits ArcScaleIndicatorCollection(of ArcScaleMarker)
```

C#

```
public class ArcScaleMarkerCollection : ArcScaleIndicatorCollection<ArcScaleMarker>
```

Remarks

Each arc scale can hold a collection of markers returned by the ArcScale.Markers property and represented by the **ArcScaleMarkerCollection** class. Each collection item is an instance of the ArcScaleMarker class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of an **ArcScaleMarkerCollection** object.

For more information on markers, refer to the Marker (Circular Scale) document.

Orientation Property

Provides different types of orientation for the marker on the Circular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Orientation As ArcScaleMarkerOrientation
```

C#

```
public ArcScaleMarkerOrientation Orientation { get; set; }
```

Property Value

An ArcScaleMarkerOrientation object that specifies possible ways the marker can be oriented.

ArcScaleMarkerOrientation Enumeration

Lists the possible ways arc scale markers can be oriented.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax
Visual Basic
```
Public Enum ArcScaleMarkerOrientation
```
C#
```
public enum ArcScaleMarkerOrientation
```

Members

Name	Description
Normal	An Arc scale marker isn't rotated when painted, and its default orientation is used. For example, in the picture below, a marker's model represents an arrow oriented from right to left.
RadialFromCenter	The Arc scale marker is rotated, so that at any point on a scale a marker is radially oriented from the scale center.
RadialToCenter	The Arc scale marker is rotated, so that at any point on a scale a marker is radially oriented to the scale center.
RotateClockwise	The Arc scale marker is rotated clockwise by 90 degrees when being painted. For example, in the picture below, a marker's model represents an arrow oriented from bottom to top.
RotateCounterclockwise	The Arc scale marker is rotated counterclockwise by 90 degrees when being painted. For example, in the picture below, a marker's model represents an arrow oriented from top to bottom.
Tangent	The Arc scale marker is rotated, so that at any point on a scale a marker is tangentially oriented to the corresponding values on a scale.
UpsideDown	The Arc scale marker is rotated by 180 degrees when being painted. For example, in the picture below, a marker's model represents an arrow oriented from left to right.

Remarks

The values listed by the **ArcScaleMarkerOrientation** enumeration are used to set the ArcScaleMarkerOptions.Orientation property.

ArcScaleNeedle Class

An arc scale needle.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleNeedle Inherits ArcScaleIndicator
```

C#

```
public class ArcScaleNeedle : ArcScaleIndicator
```

Remarks

A needle is used to point to the current value of a circular scale. An instance of an arc scale needle is represented by the ArcScaleNeedle object. It can be accessed as an item of the ArcScaleNeedleCollection object returned by the ArcScale.Needles property.

For more information on needles, refer to the Needle document.

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4241.	

The following example demonstrates how to create a Circular Gauge with two needles, three ranges, one marker and one range bar.

Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleNeedleCollection Inherits ArcScaleIndicatorCollection(of ArcScaleNeedle)
```

C#

```
public class ArcScaleNeedleCollection : ArcScaleIndicatorCollection<ArcScaleNeedle>
```

Remarks

Each arc scale can hold a collection of needles returned by the ArcScale.Needles property and represented by the **ArcScaleNeedleCollection** class. Each collection item is an instance of the ArcScaleNeedle class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of an **ArcScaleNeedleCollection** object.

For more information on needles, refer to the Needle (Circular Scale) document.

ArcScaleRange Class

An arc scale range.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleRange Inherits RangeBase
```

C#

```
public class ArcScaleRange : RangeBase
```

Remarks

A range is used to mark intervals on a circular scale. An instance of an arc scale range is represented by the ArcScaleRange object. It can be accessed as an item of the ArcScaleRangeCollection object returned by the ArcScale.Ranges property.

For more information on ranges, refer to the Range document.

An arc scale range bar.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleRangeBar Inherits ArcScaleIndicator

```

Remarks

A range bar is used to display particular intervals of a circular scale. An instance of an arc scale range bar is represented by the ArcScaleRangeBar object. It can be accessed as an item of the ArcScaleRangeBarCollection object returned by the ArcScale.RangeBars property.

For more information on range bars, refer to the Range Bar document.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property AnchorValue As Double
```

C#

```
public Double AnchorValue { get; set; }
```

Property Value

A System.Double value on a scale.

Remarks

Use the **AnchorValue** property, together with the ValueIndicatorBase.Value property (derived from the base ValueIndicatorBase class), to set the position of the entire range bar on the scale.

ArcScaleRangeBarCollection Class

A collection that stores the range bars of a particular arc scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```

ArcScaleRangeCollection Class

A collection that stores the ranges of a particular arc scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ArcScaleRangeCollection Inherits LayerCollection(of ArcScaleRange)
```

C#

```
public class ArcScaleRangeCollection : LayerCollection<ArcScaleRange>
```

Remarks

Each arc scale can hold a collection of ranges returned by the ArcScale.Ranges property and represented by the **ArcScaleRangeCollection** class. Each collection item is an instance of the ArcScaleRange class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of an **ArcScaleRangeCollection** object.

For more information on ranges, refer to the Range (Circular Scale) document.

Use the **Scales** property to add or remove scales from the gauge, as well as to customize different settings of individual gauge scales. A single scale is an instance of the ArcScale class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of an ArcScaleCollection object.

For more information on scales, refer to the Scales document.

CalcHitInfo Method

Returns information on the gauge elements located at the specified point.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Function CalcHitInfo(
   ByVal point As Point
) As CircularGaugeHitInfo
```

C#

```
public CircularGaugeHitInfo CalcHitInfo(
   Point point
)
```

Parameters

point
A **System.Windows.Point** structure which specifies the test point coordinates relative to the gauge's top-left corner.

Return Value

A CircularGaugeHitInfo object, which contains information about the gauge elements located at the test point.

Remarks

Use the **CalcHitInfo** method to determine which element is located at the specified point. For instance, this can be used when handling the gauge's **MouseDown** event to determine which element was clicked. In such cases, pass the current mouse pointer's coordinates as the method's parameter.

CircularGaugeHitInfo Class

Contains information about a specific point within a circular gauge.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class CircularGaugeHitInfo Inherits GaugeHitInfoBase
```

C#

```
public class CircularGaugeHitInfo : GaugeHitInfoBase
```

Remarks

The **CircularGaugeHitInfo** object can be created by calling the circular gauge's CircularGauge.CalcHitInfo method. This method requires the test point or its coordinates as a parameter.

The **CircularGaugeHitInfo** class properties can be grouped into two categories:

- The properties that indicate whether the test point resides over a particular view element. For instance, the InScale property indicates whether the test point is over the scale;
- The properties identifying the topmost visual element containing the test point (e.g., Scale).

CircularGaugeLayer Class

A layer of a Circular Gauge.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class CircularGaugeLayer Inherits GaugeLayerBase
```

C#

```
public class CircularGaugeLayer : GaugeLayerBase
```

Remarks

A layer specifies the appearance of the circular gauge. It is represented by a **CircularGaugeLayer** instance contained in the CircularGaugeLayerCollection object, which can be accessed via the CircularGauge.Layers property.

When a new layer is added to a circular gauge, it is painted behind all other elements, because by default, its GaugeOptionsBase.ZIndex is less than other elements. If you want to display gauge layers in front of other scale elements, set their **Zindex** to a greater value.

CircularGaugeLayerCollection Class

A collection that stores the layers of a particular circular gauge.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class CircularGaugeLayerCollection Inherits GaugeLayerCollection(of CircularGaugeLayer)

EnableAnimation Property

Gets or sets a value specifying whether value indicators should be animated when changing their values.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property EnableAnimation As Boolean
```

C#

```
public bool EnableAnimation { get; set; }
```

Property Value

true, to enable animation; otherwise, **false**.

Remarks

When the **EnableAnimation** property is set to **true**, all value indicators of a Gauge control will smoothly display changing values. Note that an indicator's ValueIndicatorBase.Value can be changed either programmatically or by using a mouse-click (when the ValueIndicatorBase.IsInteractive property of the corresponding indicator is set to **true**).

By default, the preset animation effect is used. If you want to change default settings, you should edit the ValueIndicatorBase.Animation property of a value indicator (e.g., to change the animation duration or animation function).

Use the IndicatorAnimation.Enable property to animate (inanimate) a concrete gauge's indicator, if the EnableAnimation property is set to **false** (**true**).

ScalePanelTemplate Property

Gets or sets the template that defines the presentation of a gauge's scale panel.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property ScalePanelTemplate As ItemsPanelTemplate
```

C#

```

```

Property Value

A ItemsPanelTemplate object.

LinearGauge Class

A **Linear Gauge** control.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearGauge Inherits GaugeBase
```

C#

```
public class LinearGauge : GaugeBase
```

Remarks

The **LinearGauge** class is a visual gauge control intended for creating thermometer, indicators, etc.

A gauge control is comprised of separate elements, such as level bars, scales, range bars, ranges, etc. To learn more about them, refer to the Visual Elements (Linear Gauge) section.

Parameters

point
A **System.Windows.Point** structure which specifies the test point coordinates relative to the gauge's top-left corner.

Return Value

A LinearGaugeHitInfo object, which contains information about the gauge elements located at the test point.

Remarks

Use the **CalcHitInfo** method to determine which element is located at the specified point. For instance, this can be used when handling the gauge's **MouseDown** event to determine which element was clicked. In such cases, pass the current mouse pointer's coordinates as the method's parameter.

LinearGaugeHitInfo Class

Contains information about a specific point within a linear gauge.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearGaugeHitInfo Inherits GaugeHitInfoBase
```

C#

```
public class LinearGaugeHitInfo : GaugeHitInfoBase
```

Remarks

The **LinearGaugeHitInfo** object can be created by calling the linear gauge's LinearGauge.CalcHitInfo method. This method requires the test point or its coordinates as a parameter.

The **LinearGaugeHitInfo** class properties can be grouped into two categories:

- The properties that indicate whether the test point resides over a particular view element. For instance, the InScale property indicates whether the test point is over the scale;
- The properties identifying the topmost visual element containing the test point (e.g., Scale).

LinearGaugeLayer Class

A layer of a Linear Gauge.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearGaugeLayer Inherits GaugeLayerBase
```

C#

```
public class LinearGaugeLayer : GaugeLayerBase
```

Remarks

A layer specifies the appearance of a linear gauge. It is represented by a **LinearGaugeLayer** instance contained in the LinearGaugeLayerCollection object, which can be accessed via the LinearGauge.Layers property.

When a new layer is added to the linear gauge, it is painted behind all other elements, because by default, its GaugeOptionsBase.ZIndex is less than other elements. If you want to display the linear gauge layers in front of other scale elements, set their **Zindex** to a greater value.

   int index
] { get; set; }
```

Parameters

index
A zero-based integer specifying the desired item's position within the collection. If it's negative or exceeds the last available index, an exception is raised.

Property Value

LinearScale Class

A linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScale Inherits Scale
```

C#

```
public class LinearScale : Scale
```

Remarks

This scale is used with the LinearGauge. It is represented by an instance of the LinearScale class. It can be accessed as an item of the LinearScaleCollection object returned by the LinearGauge.Scales property.

A Linear Scale consists of tickmarks, labels, custom labels, ranges and layers. It also uses the following value indicators: level bar, markers and range bars.

Example

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4242.

The following example demonstrates how to create a Linear Gauge with two ranges and one level bar.

LabelOptions Property

Gets or sets the options that specify the position and format for labels displayed on the scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property LabelOptions As LinearScaleLabelOptions
```

C#

```
public LinearScaleLabelOptions LabelOptions { get; set; }
```

Property Value

A LinearScaleLabelOptions object that contains label settings.

Remarks

Use the **LinearScaleLabelOptions** object returned by the **LabelOptions** property to customize different label settings (e.g., ScaleLabelOptions.Offset and LinearScaleLabelOptions.Orientation to set the label position on the scale).

Example

LinearScaleLabelOptions Class

Contains behavior, layout and data representation options for linear scale labels.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleLabelOptions Inherits ScaleLabelOptions
```

C#

```
public class LinearScaleLabelOptions : ScaleLabelOptions
```

Remarks

The options provided by a **LinearScaleLabelOptions** instance can be accessed by the LinearScale.LabelOptions property of a LinearScale object.

To define the behavior of the linear scale labels, use the ScaleLabelOptions.ShowFirst and ScaleLabelOptions.ShowLast properties.

The label's layout is specified by the Orientation, ScaleLabelOptions.Offset and ScaleLabelOptions.ZIndex properties.

To customize how data is represented on scale labels, use the ScaleLabelOptions.Addend, ScaleLabelOptions.Multiplier and ScaleLabelOptions.FormatString properties.

For more information on labels, refer to the Labels (Linear Scale) document.

Orientation Property

Provides different types of orientation for labels on the Linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Orientation As LinearScaleLabelOrientation
```

C#

```
public LinearScaleLabelOrientation Orientation { get; set; }
```

Property Value

A LinearScaleLabelOrientation object that specifies possible ways labels can be oriented.

LinearScaleLabelOrientation Enumeration

Lists the possible ways linear scale labels can be oriented.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Enum LinearScaleLabelOrientation
```

C#

```
public enum LinearScaleLabelOrientation
```

Members

Name	Description
BottomToTop	Linear scale labels are painted from bottom to top.
LeftToRight	Linear scale labels are painted from left to right.
TopToBottom	Linear scale labels are painted from top to bottom.

Remarks

The values listed by the **LinearScaleLabelOrientation** enumeration are used to set the LinearScaleLabelOptions.Orientation property.

LinearScaleLayer Class

A layer that contains properties to define the visual presentation of a linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleLayer Inherits ScaleLayerBase
```

C#

```
public class LinearScaleLayer : ScaleLayerBase
```

Remarks

A layer specifies the appearance of the linear scale's elements. It is represented by LinearScaleLayer object contained in the LinearScaleLayerCollection object, which can be accessed via the LinearScale.Layers property.

When a new layer is added to the linear scale, it is painted behind all other elements, because by default, its GaugeOptionsBase.ZIndex is less than other elements. If you want to display the layers in front of other scale elements, set their **Zindex** to a greater value.

A complete sample project is available in the DevExpress Code Examples database at http://www.devexpress.com/example=E4242.

The following example demonstrates how to create a Linear Gauge with two ranges and one level bar.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Options As LinearScaleLevelBarOptions
```

C#

```
public LinearScaleLevelBarOptions Options { get; set; }
```

Property Value

A LinearScaleLevelBarOptions object that contains the settings of the level bar.

Remarks

Use the **LinearScaleLevelBarOptions** object returned by the **Options** property to customize different level bar settings (e.g., LinearScaleLevelBarOptions.FactorThickness to change the level bar's shape on the Linear scale).

LinearScaleLevelBarCollection Class

A collection that stores the level bars of a particular linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleLevelBarCollection Inherits LinearScaleIndicatorCollection(of LinearScaleLevelBar)
```

C#

```
public class LinearScaleLevelBarCollection : LinearScaleIndicatorCollection<LinearScaleLevelBar>
```

Remarks

Each linear scale can hold a collection of level bars returned by the LinearScale.LevelBars property and represented by the **LinearScaleLevelBarCollection** class. Each collection item is an instance of the LinearScaleLevelBar class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of a **LinearScaleLevelBarCollection** object.

For more information on level bars, refer to the Level Bar (Linear Scale) document.

FactorThickness Property

Gets or sets a value by which the level bar's thickness should be multiplied.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property FactorThickness As Double
```

C#

```
public Double FactorThickness { get; set; }
```

Property Value

A System.Double value that is the level bar's thickness multiplier.

Remarks

Use the **FactorThickness** property to modify the thickness of a level bar on a scale.

For more information on level bars, refer to the Level Bar document.

Offset Property

Gets or sets the offset specifying a level bar's position on a Linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the level bar's offset.

Remarks

Use the **Offset** property if you need to customize the position of the level bar with respect to other elements of a Linear scale. Note that increasing the **Offset** property's value moves a level bar to the right, while decreasing **Offset** moves it to the left.

LinearScaleMarker Class

A linear scale marker.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleMarker Inherits LinearScaleIndicator
```

C#

```
public class LinearScaleMarker : LinearScaleIndicator
```

Remarks

A marker is used to indicate an invariable value of a linear scale. An instance of a linear scale marker is represented by the LinearScaleMarker object. It can be accessed as an item of the LinearScaleMarkerCollection object returned by the LinearScale.Markers property.

For more information on markers, refer to the Marker document.

public class LinearScaleMarkerCollection : LinearScaleIndicatorCollection<LinearScaleMarker>
```

Remarks

Each linear scale can hold a collection of markers returned by the LinearScale.Markers property and represented by the **LinearScaleMarkerCollection** class. Each collection item is an instance of the LinearScaleMarker class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of a **LinearScaleMarkerCollection** object.

For more information on markers, refer to the Marker (Linear Scale) document.

LinearScaleRange Class

A linear scale range.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleRange Inherits RangeBase
```

C#

```

AnchorValue Property

Gets or sets the value on a scale that specifies the fixed edge of the range bar.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property AnchorValue As Double
```

C#

```
public Double AnchorValue { get; set; }
```

Property Value

A System.Double value on a scale.

Remarks

Use the **AnchorValue** property together with the ValueIndicatorBase.Value property (derived from the base ValueIndicatorBase class) to set the position of the entire range bar on the scale.

Options Property

Gets or sets the options of a range bar that specify its shape and position on a Linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Options As LinearScaleRangeBarOptions
```

C#

```
public LinearScaleRangeBarOptions Options { get; set; }
```

Property Value

An LinearScaleRangeBarOptions object that contains the settings of the range bar.

Remarks

Use the **LinearScaleRangeBarOptions** object returned by the **Options** property to customize different range bar settings (e.g., RangeBarOptionsBase.Offset and RangeBarOptionsBase.Thickness properties to set the range bar's position and customize its appearance on the Linear scale).

LinearScaleRangeBarCollection Class

A collection that stores the range bars of a particular linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleRangeBarCollection Inherits LinearScaleIndicatorCollection(of LinearScaleRangeBar)
```

C#

```
public class LinearScaleRangeBarCollection : LinearScaleIndicatorCollection<LinearScaleRangeBar>
```

Remarks

Each linear scale can hold a collection of range bars returned by the LinearScale.RangeBars property and represented by the **LinearScaleRangeBarCollection** class. Each collection item is an instance of the LinearScaleRangeBar class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of a **LinearScaleRangeBarCollection** object.

For more information on range bars, refer to the Range Bar (Linear Scale) document.

LinearScaleRangeCollection Class

A collection that stores the ranges of a particular linear scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class LinearScaleRangeCollection Inherits LayerCollection(of LinearScaleRange)
```

C#

```
public class LinearScaleRangeCollection : LayerCollection<LinearScaleRange>
```

Remarks

Each linear scale can hold a collection of ranges returned by the LinearScale.Ranges property and represented by the **LinearScaleRangeCollection** class. Each collection item is an instance of the LinearScaleRange class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of a **LinearScaleRangeCollection** object.

For more information on ranges, refer to the Range (Linear Scale) document.

MajorTickmarkOptions Class

Contains settings that define the layout and behavior of the major tickmarks along the scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class MajorTickmarkOptions Inherits TickmarkOptions

C#

```
public class MajorTickmarkOptions : TickmarkOptions
```

Remarks

The options provided by a **MajorTickmarkOptions** instance can be accessed via the Scale.MajorTickmarkOptions property of a Scale object.

To define the layout of the major tickmarks, use the GaugeOptionsBase.ZIndex, TickmarkOptions.Offset, TickmarkOptions.FactorThickness and TickmarkOptions.FactorLength properties.

The behavior of the major tickmarks is set by the ShowFirst and ShowLast properties.

FactorWidth Property

Gets or sets a value by which the marker's width should be multiplied.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property FactorWidth As Double
```

C#

```
public Double FactorWidth { get; set; }
```

Property Value

A System.Double value that is the marker's width multiplier.

Remarks

Use the **FactorWidth** and FactorHeight properties to modify the marker's proportion on a scale. Note that you may need to change the marker's Offset property to arrange its position on a scale.

For more information on markers, refer to the Marker (Circular Scale) and Marker (Linear Scale) documents.

Offset Property

Gets or sets the offset specifying a marker's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the marker's offset.

Remarks

Use the **Offset** property, if you need to customize the position of the marker with respect to other elements of a scale. Note that the **Offset** property behavior is different of Circular scale markers and Linear scale markers.

For the **Circular** scale, the positive value of the **Offset** property moves a marker out of the scale, while a negative value moves a marker inside the scale towards to the center. A zero value of the **Offset** property means the marker is positioned on the edge of the Circular scale.

In the case of the **Linear** scale, increasing the **Offset** property's value moves a marker to the right, while decreasing **Offset** moves it to the left.

MinorTickmarkOptions Class

Contains settings that define the layout and behavior of the minor tickmarks along the scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class MinorTickmarkOptions Inherits TickmarkOptions
```

C#

```
public class MinorTickmarkOptions : TickmarkOptions
```

Remarks

The options provided by a **MinorTickmarkOptions** instance can be accessed via the Scale.MinorTickmarkOptions property of a Scale object.

To define the layout of the minor tickmarks, use the GaugeOptionsBase.ZIndex, TickmarkOptions.Offset, TickmarkOptions.FactorThickness and TickmarkOptions.FactorLength properties.

The behavior of the minor tickmarks is set by the ShowTicksForMajor property.

For more information on minor tickmarks, refer to the Tickmarks (Circular Scale) and Tickmarks (Linear Scale) documents.

ShowTicksForMajor Property

Gets or sets a value indicating whether or not minor tickmarks should be visible at the positions of the corresponding major tickmarks.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property ShowTicksForMajor As Boolean
```

C#

```
public bool ShowTicksForMajor { get; set; }
```

Property Value

true to display minor tickmarks at the major tickmark positions; otherwise **false**.

Remarks

Usually major and minor tickmarks are alternately displayed on a scale and therefore, there is no need to show minor tickmarks at the major tickmark position. So, the **ShowTicksForMajor** property is set to **false** by default.

But in some cases, you may need to display both major and minor tickmarks for the same value (e.g., if major tickmarks aren't hidden or if the TickmarkOptions.Offset property for major tickmarks differs from the corresponding property for minor tickmarks). In such situations, you are required to show minor tickmarks at the major tickmarks position. To achieve this, set the **ShowTicksForMajor** property to **true**.

RangeBarOptionsBase Class

Serves as the base class for range bar options.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class RangeBarOptionsBase Inherits GaugeOptionsBase
```

C#

```
public abstract class RangeBarOptionsBase : GaugeOptionsBase
```

Remarks

The **RangeBarOptionsBase** class provides all functional capabilities that are common for range bars derived from it (e.g., ArcScaleRangeBarOptions returned by the ArcScaleRangeBar.Options property, etc.)

Offset Property

Gets or sets the offset specifying a range bar's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the range bar's offset.

Remarks

Use the **Offset** property, if you need to customize the position of the range bar with respect to other elements of a scale. Note that the **Offset** property behavior is different for Circular scale range bars and Linear scale range bars.

For the **Circular** scale, a positive value of the **Offset** property moves a range bar out of the scale, while a negative value moves a range bar inside the scale towards to the center. A zero value of the **Offset** property means the range bar is positioned on the edge of the Circular scale.

In the case of the **Linear** scale, increasing the **Offset** property's value moves a range bar to the right, while decreasing **Offset** moves it to the left.

Thickness Property

Gets or sets a value that specifies the thickness of the range bar on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Thickness As Integer
```

C#

```
public int Thickness { get; set; }
```

Property Value

A System.Int32 value that is the thickness of the range bar.

Remarks

Use the **Thickness** property if you need to modify the range bar's thickness for Circular and Linear scales.

For more information on range bars, refer to the Range Bar (Circular Scale) and Range Bar (Linear Scale) documents.

RangeBase Class

Serves as the base class for all ranges.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class RangeBase Inherits LayerBase, IHitTestableElement
```

C#

```
public abstract class RangeBase : LayerBase, IHitTestableElement
```

Remarks

The **RangeBase** class provides all functionality that is common for ranges derived from it (e.g., the ArcScaleRange returned by the ArcScale.Ranges property, etc.)

IndicatorEnter Event

Occurs when any value indicator enters the current range.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
event Public IndicatorEnter As IndicatorEnterEventHandler
```

C#

```
public event IndicatorEnterEventHandler IndicatorEnter
```

Event Data

The event handler receives an argument of type IndicatorEnterEventArgs containing data related to this event.

The following **IndicatorEnterEventArgs** properties provide information specific to this event.

Property	Description
Indicator	Gets the object for which either the IndicatorEnter or IndicatorLeave event has been raised.
NewValue	Gets the new value of a property.
OldValue	Gets the old value of a property.

Remarks

The **IndicatorEnter** event occurs if any value indicator, belonging to the same scale as the current range object, has a ValueIndicatorBase.Value property greater than or equal to the StartValue and less than the EndValue properties of the current range. Note that the **IndicatorEnter** event is invoked irrespective of the way an indicator's value was changed - either via a mouse-click on a range or programmatically via code.

The **IndicatorEnter** and IndicatorLeave events can be used together for various purposes (e.g., to create a state indicator).

IndicatorLeave Event

Occurs when any value indicator leaves the current range.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
event Public IndicatorLeave As IndicatorLeaveEventHandler
```

C#

```
public event IndicatorLeaveEventHandler IndicatorLeave
```

Event Data

The event handler receives an argument of type IndicatorLeaveEventArgs containing data related to this event.

The following **IndicatorLeaveEventArgs** properties provide information specific to this event.

Property	Description
Indicator	Gets the object for which either the IndicatorEnter or IndicatorLeave event has been raised.
NewValue	Gets the new value of a property.
OldValue	Gets the old value of a property.

Remarks

The **IndicatorLeave** event occurs if a value indicator that previously entered the current range (for which the IndicatorEnter event was raised) now has a ValueIndicatorBase.Value property that is less than the StartValue or greater than or equal to the EndValue properties of the current range. Note that the **IndicatorLeave** event is invoked irrespective of the way an indicator's value was changed - either via mouse-click on a range or programmatically in code.

The IndicatorEnter and **IndicatorLeave** events can be used together for various purposes (e.g., to create a state indicator).

RangeOptions Class

Contains layout and appearance options for a range.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class RangeOptions Inherits GaugeOptionsBase
```

C#

```
public class RangeOptions : GaugeOptionsBase
```

Remarks

The options provided by a **RangeOptions** instance can be accessed via the RangeBase.Options property of a RangeBase object.

To define the layout of the ranges, use the GaugeOptionsBase.ZIndex and Offset property.

The appearance of the ranges is set by the Thickness property.

Offset Property

Gets or sets the offset specifying a range's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the range's offset.

Remarks

Use the **Offset** property, if you need to customize the position of the range with respect to other elements of a scale. Note that the **Offset** property behavior is different for Circular scale ranges and Linear scale ranges.

For the **Circular** scale, a positive value of the **Offset** property moves a range out of the scale, while a negative value moves a range inside the scale towards to the center. A zero value of the **Offset** property means the range is positioned on the edge of the Circular scale.

In the case of the **Linear** scale, increasing the **Offset** property's value moves a range to the right, while decreasing **Offset** moves it to the left.

Syntax

Visual Basic

```
Public Property Thickness As Integer
```

C#

```
public int Thickness { get; set; }
```

Property Value

A System.Int32 value that is the thickness of the range.

Remarks

Use the **Thickness** property if you need to modify the range's thickness for Circular and Linear scales.

For more information on ranges, refer to the Range (Circular Scale) and Range (Linear Scale) documents.

Offset Property

Gets or sets the offset specifying a custom label's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the custom label's offset.

Remarks

The custom label position on the scale is defined by **Offset** and Value properties. The **Value** property sets the value near which the custom label is located.

Use the **Offset** property, if you need to customize the position of the custom label with respect to other elements of a scale. Note that the **Offset** property behavior is different for Circular scale custom labels and Linear scale custom labels.

For the **Circular** scale, a positive value of the **Offset** property moves a custom label out of the scale, while a negative value moves a custom label inside the scale towards to the center. A zero value of the **Offset** property means that the custom label is positioned on the edge of the Circular scale.

In the case of a **Linear** scale, increasing the **Offset** property's value moves a custom label to the right, while decreasing the **Offset** moves it to the left.

Value Property

Gets or sets the value at which the custom label is located on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Value As Double
```

C#

```
public Double Value { get; set; }
```

Property Value

A System.Double value.

Remarks

Use the **Value** property together with the Offset to set the position of the custom label on the scale.

ScaleCustomLabelCollection Class

A collection that stores the custom labels of a particular scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ScaleCustomLabelCollection Inherits GaugeLayoutElementCollection(of ScaleCustomLabel)
```

C#

```
public class ScaleCustomLabelCollection : GaugeLayoutElementCollection<ScaleCustomLabel>
```

Remarks

Each linear scale can hold a collection of custom labels returned by the Scale.CustomLabels property and represented by the **ScaleCustomLabelCollection** class. Each collection item is an instance of the ScaleCustomLabel class and can be accessed via the System.Collections.ObjectModel.Collection<T>.Item property of a **ScaleCustomLabelCollection** object.

Addend Property

Gets or sets a value that should be added to every label's value.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Addend As Double
```

C#

```
public Double Addend { get; set; }
```

Property Value

A System.Double value which is added to every label's value on a scale.

Remarks

Use the **Addend** property, if you need to apply the addition operation to every label's value on a scale. Note that this property affects only values displayed in a scale label and doesn't change the values of any other gauge elements (e.g., value indicators).

Foreground Property

Gets or sets the foreground color of scale labels.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Foreground As Brush
```

C#

```

```

Property Value

A Brush object.

Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property FormatString As String
```

C#

```
public string FormatString { get; set; }
```

Property Value

A System.String value that is the format string of a label.

Remarks

Use the **FormatString** property to define the specific string format for the scale's label.

For more information on labels, refer to the Labels (Circular Scale) and Labels (Linear Scale) documents.

Multiplier Property

Gets or sets a value by which every label's value should be multiplied.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Multiplier As Double
```

C#

```
public Double Multiplier { get; set; }
```

Property Value

A System.Double value which is a multiplier applied to every label's value on a scale.

Remarks

Use the **Multiplier** property if you need to apply a multiplier to every label's value on a scale. Note that this property affects only values displayed in scale label and doesn't change the value of any other gauge element (e.g., value indicators).

Offset Property

Gets or sets the offset specifying a label's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the label's offset.

Remarks

Use the **Offset** property, if you need to customize the position of the label with respect to other elements of a scale. Note that the **Offset** property behavior is different for Circular scale labels and Linear scale labels.

For the **Circular** scale, a positive value of the **Offset** property moves a label out of the scale, while a negative value moves a label inside the scale towards to the center. A zero value of the **Offset** property means the label is positioned on the edge of the Circular scale.

In the case of the **Linear** scale, increasing the **Offset** property's value moves a label to the right, while decreasing **Offset** moves it to the left.

ShowFirst Property

Gets or sets a value indicating whether or not the first label should be shown on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property ShowFirst As Boolean
```

C#

```
public bool ShowFirst { get; set; }
```

Property Value

true to display the first label on a scale; otherwise **false**.

Remarks

Use **the ShowFirst** and ShowLast properties to show or hide the first and last labels on a scale. This may be required, for example, when these labels are both displayed at the same position and the resulting gauge looks ugly. In this case, you can hide the first label by setting the **ShowFirst** property to **false**.

For more information on labels, refer to labels (Circular scale) and labels (Linear scale) documents.

Options Property

Provides access to the settings that specify the shape and position of the current scale layer.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Options As LayerOptions
```

C#

```
public LayerOptions Options { get; set; }
```

Property Value

A LayerOptions object that contains the settings of the layer.

Remarks

Use the **LayerOptions** object returned by the **Options** property to customize different layer settings (e.g., the GaugeOptionsBase.ZIndex property to set the stacking order of the different layers on the scale).

ScaleLineOptions Class

Contains layout and appearance options for a scale line.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ScaleLineOptions Inherits GaugeOptionsBase
```

C#

```
public class ScaleLineOptions : GaugeOptionsBase
```

Remarks

The options provided by a **ScaleLineOptions** instance can be accessed via the Scale.LineOptions property of a Scale object.

To define the layout of the line, use the GaugeOptionsBase.ZIndex and Offset property.

The appearance of the lines is set by the Thickness property.

For more information on lines, refer to the Line (Circular Scale) and Line (Linear Scale) documents.

Offset Property

Gets or sets the offset specifying a line's position on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Offset As Double
```

C#

```
public Double Offset { get; set; }
```

Property Value

A System.Double value that specifies the line's offset.

Remarks

Use the **Offset** property, if you need to customize the position of the line with respect to other elements of a scale. Note that the **Offset** property behavior is different for Circular scale line and Linear scale line.

For the **Circular** scale, a positive value of the **Offset** property moves a line out of the scale, while a negative value moves a line inside the scale towards to the center. A zero value of the **Offset** property means the line is positioned on the edge of the Circular scale.

In the case of the **Linear** scale, increasing the **Offset** property's value moves a line to the right, while decreasing **Offset** moves it to the left.

Thickness Property

Gets or sets a value that specifies the thickness of the line on a scale.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Property Thickness As Integer
```

C#

```
public int Thickness { get; set; }
```

Property Value

A System.Int32 value that is the thickness of the line.

Remarks

Use the **Thickness** property if you need to modify the line's thickness for Circular and Linear scales. Note that the Scale.ShowLine property should be set to **true** to display the line on a scale.

For more information on lines, refer to the Line (Circular Scale) and Line (Linear Scale) documents.

SpindleCapOptions Class

Contains layout options for a spindle cap.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class SpindleCapOptions Inherits GaugeOptionsBase
```

C#

```
public class SpindleCapOptions : GaugeOptionsBase
```

Remarks

The options provided by a **SpindleCapOptions** instance can be accessed via the ArcScale.SpindleCapOptions property of an ArcScale object.

To define the layout of the spindle cap, use the GaugeOptionsBase.ZIndex, FactorHeight and FactorWidth properties.

For more information on spindle caps, refer to the Spindle Cap document.

ValueChangedEventArgs Class

Provides data for the ValueIndicatorBase.ValueChanged event.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Class ValueChangedEventArgs Inherits EventArgs
```

C#

```
public class ValueChangedEventArgs : EventArgs
```

Remarks

The ValueIndicatorBase.ValueChanged event occurs when the ValueIndicatorBase.Value property has been changed. Note that this event is invoked irrespective of the way an indicator's value was changed - either by a mouse-click on a range or programmatically in code.

The ValueChangedEventArgs class provides the OldValue and NewValue properties that return the previous and current values of the ValueIndicatorBase.Value property.

An instance of the **ValueChangedEventArgs** class with appropriate settings is automatically created and passed to the corresponding event's handler.

Namespace: DevExpress.UI.Xaml.Gauges
Assembly: DevExpress.UI.Xaml.Gauges.v18.1.dll

Syntax

Visual Basic

```
Public Delegate Sub ValueChangedEventHandler(

)
```

Parameters

The declaration of your event handler must have the same parameters as the **ValueChangedEventHandler** delegate declaration.
sender
The event source.
e
A ValueChangedEventArgs object that contains event data.

Remarks

When creating a ValueChangedEventHandler delegate, you identify the method that will handle the corresponding event. To associate an event with your event handler, add a delegate instance to this event. The event handler is called whenever the event occurs, unless you remove the delegate. For more information about event handler delegates, see **Events and Delegates** in **MSDN**.

  IHitTestableElement
```

C#

```

AutoFilterCondition Enumeration

Namespace: DevExpress.UI.Xaml.Grid
Assembly: DevExpress.UI.Xaml.Grid.v18.1.dll

Syntax

Visual Basic

```
Public Enum AutoFilterCondition
```

C#

```
public enum AutoFilterCondition
```

Members

Name	Description
Contains	The **Contains** operator is used to create filter conditions. This operator selects records whose values in the corresponding column contain the entered string.
Default	For string values, the **Like** comparison operator is used to create filter conditions. This operator selects records whose values in the corresponding column start with the entered string. For other values (e.g. Boolean, numeric), the **Equals** comparison operator is used.
Equals	The **Equals** comparison operator is used to create filter conditions. This operator selects records whose values in the corresponding column match the entered value.
Like	The **Like** comparison operator is used to create filter conditions. This operator selects records whose values in the corresponding column start with the entered string.

Remarks

The automatic filter row allows end-users to filter data on the fly, by typing text within the row's cell. This automatically creates a filter condition against the corresponding column. The comparison operator used in this condition is determined by the column's ColumnBase.AutoFilterCondition property.
